OneYP — Dashboard completo

Exportação detalhada: visão global, México, Peru, Equador, Puebla Project, pesquisas, roadmap UX e benchmark.

Gerado em 2026-10-13 · Fonte: oneyp.vercel.app · Formato: relatório estruturado (não é captura de tela por aba).

OneYP 2027 — Dashboard reader edition

Generated October 13, 2026 from oneyp.vercel.app data modules.

This document is structured for reading: executive narrative first, then country field evidence, research, roadmap and workshops. Raw interview transcripts and machine JSON are omitted; use the full context export for LLM archival.

Contents

- 1. Global cross-country view
- 2. Stakeholder lenses (Consumer, Rewards, Service level)
- 3. Mexico — CDMX, Puebla, internal sessions
- 4. Peru — Lima visits and synthesis
- 5. Ecuador — Oct 7 prep + Oct 8 OYP workshop
- 6. Colombia — Sep 13 product intro (1YP)
- 7. Puebla Project — CX rotation + regional stores
- 8. Research (Pesquisas) and sellers/couriers survey
- 9. UX & product roadmap (incl. backlog item IDs)
- 10. Competitors benchmark
- 11. Insight guide (dashboard Q&A)
- 12. Appendix — source transcripts index

---

1. Global cross-country view

Executive summary

All evidence converges on one story: TaDa grows when the promise survives the handoff — stock, seller, courier, address, ETA and recovery — across countries, cities and occasions.

Field and organization (Mexico Jul; Peru Aug–Sep; Ecuador Oct 7–8; Colombia Sep 13 product intro) locate the problem: peak periods break seller/courier tooling, stock shows zero or infinite without quantity (or off in BEES while ERP has stock), payments stay off after fraud trauma, WhatsApp becomes the operating layer and SLA penalizes a ready seller without a courier. Colombia adds marketplace/bank-acquisition mix and own-store vs Community POC as a dual seller model.

Seller/courier research adds the missing actor to the cross-country view: 85 Small in discovery sellers have 3.86/5 satisfaction and 2.9/8 metrics; 46.9% of couriers cite communication and 36.5% routes/address. The same handoff appears as stockout, waiting, delay, cancellation and ticket.

Lovers Plus shows that the opportunity is operational retention: 92% Perfect Orders and 48% SLA15 versus 35% Core; churn and reviews show that availability, support and recovery matter more than adding persuasion. Consumer and Rewards should therefore be sequenced on reliability and data.

Competitors expand the frame to Colombia and the strategic choice: Rappi is the benchmark in all three countries; Uber adds mobility/retail in Mexico; PedidosYa competes on density/fintech in Peru. TaDa should compete by mission and trust, measuring total price, ETA, failure, recovery and frequency — not feature count.

Key figures:

- Countries field + benchmark: 4
- POCs + sessions: 12 + 10
- Cross-themes + lenses: 35 + 8
- Research respondents: 1.630+ reviews · 1.506 surveys

Ranked insights

#1 · Critical · Seller reliability at peak — sound, session, map load, expired orders

Orders expire or never reach the courier when the app is backgrounded, silent, or frozen. Same outcome in CDMX Saturdays, Puebla World Cup peaks, and Peru quiet shifts.

Coverage: MX 6/9 POCs · PE 2/3 · *Layer:* Reliability · *Countries:* Mexico, Peru

UX roadmap IDs: order-alert-session, courier-order-push, map-assign-stay

Suggestion: Reliable push + sound on seller and courier. Session persistence through a full peak. Map loads 50+ concurrent orders without blank screen.

Owners: Eng. Seller/Courier · PM Seller · OPS

- MX CDMX 3/4: order doesn't reach courier without refresh
- MX Puebla 3/5: app closes 4–5×/day (Zavaleta); no sound → expired orders (San Jerónimo); map blank at 20 orders (Forjadores)
- PE Merino + San Pedro: notification sound intermittent — missed orders while picking alone

#2 · Critical · GPS / map does not update in real time

Courier pin stuck at store after leaving; only 1–2 riders visible on peak. Consumer and seller see stale position — ~80% of 'late' complaints are display, not delivery time.

Coverage: MX 4/4 CDMX · PE 3/3 Lima · *Layer:* Reliability · *Countries:* Mexico, Peru

UX roadmap IDs: cx-courier-map-visibility, courier-route-map, ya-llegue-fix

Suggestion: Foreground/background pin updates. CX read-only live map. 'Ya llegué' push that consumer actually sees.

Owners: Eng. Seller/Courier · CX (Diego)

- MX CDMX 4/4: pin stuck, tracking disappears on return
- PE 3/3: 5–10% map visibility on Saturday — WhatsApp workaround everywhere
- CX meeting: agents completely blind to courier position

#3 · Critical · Inventory without real quantity — search and combos broken

On/off toggle does not reflect stock. No quantity field; combos don't disable together; search misses brand/format. Orders arrive on turned-off SKUs.

Coverage: MX 4/4 CDMX · PE 3/3 · EC Oct 8 POC qty (2 votes) · Puebla search · *Layer:* Portfolio · *Countries:* Mexico, Peru, Ecuador

UX roadmap IDs: portfolio-quantity, portfolio-filters, portfolio-unified

Suggestion: Quantity MVP with optional auto-decrement. Parent SKU disables variants. Search by brand/format. Compose combos from two active SKUs (Victor Ágora ask in both countries).

Owners: PM Seller · Design · CX

- MX CDMX unanimous #1 ask — Los Alpes 'top priority'
- MX Puebla: search breaks on modelo/combos; snack group shows 5/20 items
- PE 3/3: Flor de Caña off but combo SKU still accepts orders; VTEX/Tuca benchmark cited
- PE morning context: combo-as-third-SKU pain — same as Mexico
- EC Oct 7: no seller quantity → consumer cancel option raised cancellations; team wants suggested replenishment
- EC Oct 8 workshop: stock zero/infinite in seller; manual Pareto off at 4 units; peak sell-through leaves SKU on → cancellations (2 votes POC qty)
- EC Oct 8: Vitex-style daily load removed post-BEES — want theoretical opening stock minus sales

#4 · Critical · Wrong POC routing — overlap, spillover, cancel-to-route

Customer gets distant store; neighbor turns off SKU and volume floods one POC; consumer cancels 10–12× to hit preferred store when name is visible in app.

Coverage: MX 6/9 · PE 2/3 · Product overlap test · *Layer:* Peak ops · *Countries:* Mexico, Peru

UX roadmap IDs: admin-polygon-neighbor, dispatch-sla-split

Suggestion: Run overlap/cancellation tests. Limit spillover when neighbor disables SKU. Review late-hours polygons. Hide or de-emphasize store name in consumer routing.

Owners: PM Product · OPS · Data

- MX CDMX 3/4 + Puebla 3/5: nearby client routed elsewhere
- MX Forjadores absorbs Zavaleta + San Jerónimo spillover when neighbors disable SKUs
- PE Merino +70 orders/weekend when coverage moved; cancel-to-route gaming
- Product meeting: Puebla overlap test ~3%

#5 · High · Dispatch SLA unfair — order ready, no courier for 10–15 min

Metric goes red when seller prepared in 2–3 min but rider arrives at 15 min. World Cup: 40–50 orders / 8 couriers in 5 minutes.

Coverage: MX Puebla 3/5 · PE peak pattern · *Layer:* Peak ops · *Countries:* Mexico, Peru

UX roadmap IDs: dispatch-sla-split, multi-assign-seller, map-kanban-unified

Suggestion: Split 'prepared' vs 'picked up' timestamps. Peak-adjusted targets. Multi-assign to courier already en route.

Owners: PM Seller · Data · OPS

- MX Zavaleta: ready at 3 min, courier at 15 min — dispatch red, delivery OK
- MX Forjadores: 50 orders / 8 riders — impossible 10-min dispatch for all
- PE San Pedro: 7 couriers 18h/day in 3.5 km — TML 10 lowest in visit set

#6 · High · No in-app seller ↔ customer / courier communication

100% WhatsApp and phone calls. No audit trail. Deposit-bottle disputes, door waits, wrong-SKU coordination — sellers remember having chat in a previous tool.

Coverage: MX 4/4 CDMX · PE 3/3 · EC Oct 8 vote · *Layer:* Communication · *Countries:* Mexico, Peru, Ecuador

UX roadmap IDs: in-app-chat-seller, cx-predefined-messages, cx-fast-seller-channel

Suggestion: Pilot pre-defined seller→customer messages (MX + PE). Fast seller↔CX channel for peak — not email-only.

Owners: PM CX · PM Seller

- MX CDMX 4/4: WhatsApp default; courier calls 90% on arrival
- MX Puebla: Talabera CX email next day — slower than phone
- PE 3/3: no channel; La Marina 4–5 of 50 orders with bottle disputes → 1-star
- CX meeting: ~40% tickets are coordination; pilot pre-defined messages agreed
- EC Oct 8: consumer ↔ courier messaging voted (2); ties to wrong address and cancel-after-dispatch

#7 · High · KPIs locked to 7 days — no daily / hourly / calendar week

Sellers cannot see yesterday or Mon–Sun week. Ranking peer set opaque. SLA 35 hidden in seller UI. Forecast shows 30 orders, 7 arrive.

Coverage: MX 4/4 CDMX + 2/5 Puebla · PE 3/3 · EC Oct 7–8 · *Layer:* Metrics · *Countries:* Mexico, Peru, Ecuador

UX roadmap IDs: metrics-date-filter, metrics-hourly, metrics-ai-mvp, admin-kpi-cockpit, admin-b2b-courier-forecast, forecast-trust

Suggestion: Date filter (day/week/month). Hourly heatmap (orders + couriers). AI explanations for opaque metrics. Resume OPS Power BI cockpit per POC.

Owners: PM Seller · OPS · Data

- MX CDMX 4/4: 7-day rolling window prevents daily management
- MX Zavaleta: wants orders/hour + couriers/hour (today via Excel)
- PE 3/3: rolling 7 days; SLA 35 hidden; rank #32 without knowing algorithm
- PE WebPO: weekly Mon–Sun view praised — partial local fix
- EC Oct 7: supervisors run Power BI FOR + projection calculators; seller home KPI page unused by POCs
- EC: motorizado need/hour built in Excel from BEES raw data — wants platform automation
- EC Oct 7: supervisors share motorizado forecast via WhatsApp from BEES export — not in seller platform

#8 · High · Promo calendar misaligned with supply and seller visibility

Consumer sees promo before seller can stock. Supply delivers once/week; promo ladder with 1–2 days notice. BEES/WebPO doesn't alert on consumer promos.

Coverage: MX Puebla 3/5 · PE context + WebPO gap · *Layer:* Commercial · *Countries:* Mexico, Peru

UX roadmap IDs: notification-center, admin-sku-promo-protection

Suggestion: 7+ day promo notice to sellers. 2–3 weekly delivery slots. Promo alert in seller platform + supply (not only consumer app). Centralize promo calendar.

Owners: Commercial · OPS · PM Seller

- MX Forjadores: Corona 30→50% World Cup, 250 cartons ordered, still stockout
- MX San Jerónimo: order Fri → deliver Tue; promo Sat
- PE La Marina: Stella promo in consumer app but not BEES — can't pre-stock
- Promo workshop: planning fragmented across Excel, Trello, WhatsApp

#9 · High · Reimbursement and payment transparency

Sellers reconcile in Excel/notebook because platform numbers are opaque. Weekly VLC breakdown and credit notes work in Peru WebPO — same ask in Mexico meetings.

Coverage: MX 4/4 pattern · PE WebPO validated · *Layer:* Metrics · *Countries:* Mexico, Peru

UX roadmap IDs: reimbursement-breakdown, financial-report-date-filter, courier-jumbo-seller-view

Suggestion: Line-by-line weekly reimbursement with drill-down to order. Bring WebPO payment UX into official seller platform.

Owners: PM Seller · Finance · OPS

- MX Bahia: 30 min/week manual reconciliation in Excel
- MX Churubusco: trusts payment but cannot audit order by order
- PE WebPO: S/ total – delivery = monto a facturar with downloadable detail
- Product meeting: Courier Financial Report (Jumbo) launching

#10 · High · Operations map UX — assign kicks off screen, blank under load

Assigning a courier navigates away from map or freezes the table. Store pin disappears. Sellers want map + kanban on one screen.

Coverage: MX 4/4 CDMX · PE map pain compounds · *Layer:* Peak ops · *Countries:* Mexico, Peru

UX roadmap IDs: map-assign-stay, map-kanban-unified, map-visual-priority

Suggestion: Assign without leaving map. Visual priority (not all red). Unified map + kanban pilot at one POC.

Owners: PM Seller · Design

- MX Los Alpes: 'ideal is it doesn't take us out of this screen'
- MX Forjadores: zoom to assign loops back — 20 orders invisible
- PE: map useless for dispatch at peak — WhatsApp replaces it
- Interview script: Figma map+kanban tested in every CDMX visit

#11 · Medium · Cold chain and volume promos — fridge, ice, returnables, cartons

Carton promos exceed fridge capacity. Ice at seller cost. Returnables stack 2–4 cartons on moto. Peru ~60% returnable; Puebla 4/5 report warm product.

Coverage: MX Puebla 4/5 · PE 2/3 · *Layer:* Infra · *Countries:* Mexico, Peru

Suggestion: Ice machine program for high-volume POCs. Carton promo fridge playbook. Returnable bag redesign for multi-carton.

Owners: OPS · Commercial

- MX Puebla: max 5 cartons in fridge; 10-carton orders go warm
- MX Mixcoac: no space for ice; hot product complaints
- PE Merino: 28-bottle promo hated; couriers stack 4 cartons with rubber bands
- PE context: returnables = differentiator vs Rappi

#12 · Medium · CX / support channel too slow for peak coordination

Email tickets answered next day. Sellers resolve faster by phone than platform. Mandatory cancellation reasons lost in free-text.

Coverage: MX Puebla 2/5 + CX · PE deposit disputes · *Layer:* Communication · *Countries:* Mexico, Peru

UX roadmap IDs: cx-fast-seller-channel, cx-cancellation-reason, cx-unified-seller-view

Suggestion: WhatsApp-speed seller support channel. Mandatory structured cancellation reasons visible to CX.

Owners: PM CX · OPS

- MX Talabera + Forjadores: CX email next day
- CX meeting: mandatory cancellation reason — 'other' field lost
- PE: disputes drive 1-star when no seller-customer channel

#13 · Medium · Courier app stability and peak economics

App freezes requiring reinstall. Offline sync issues. Couriers compare Uber economics; peak bonuses worked in World Cup but not systematic.

Coverage: MX 3/4 CDMX · PE assignment bugs · *Layer:* Reliability · *Countries:* Mexico, Peru

UX roadmap IDs: courier-order-push, courier-financial-statement, courier-earnings-daily

Suggestion: Android crash fix. Structured peak incentives. Courier earnings visibility (Jumbo report).

Owners: PM Courier · Eng. · OPS

- MX Churubusco: courier app freezes — needs reinstall
- MX Puebla: peak bonus brought riders; Uber pays more
- PE La Marina: assign freezes — key sent, order stuck in waiting
- OPS workshop: Android version issues on courier phones

#14 · Medium · Fill Rate and address quality — product + ops lever

Fill Rate flat ~92% in Peru (target 93%). Wrong address and no-answer drive cancellations. Brazil location UX candidate (–1 pp location cancellations).

Coverage: PE national KPI · MX Fill Rate pressure · *Layer:* Commercial · *Countries:* Mexico, Peru

Suggestion: Roll out Brazil location UX in Peru (config). Fill Rate cut by new vs returning users. Pair ops pressure with address product fix.

Owners: PM Consumer · OPS · Data (Bruno Masayoli)

- PE context: Fill Rate stuck since 2024; address modal launched last weekend
- MX Bahia: Fill Rate –8 pp Jun→Jul
- Brazil benchmark: 50% faster location input, –1 pp location cancellations
- PE San Pedro: 12.2% seller cancellations

#15 · Critical · Inventory real-time is the strategic unlock — not another dashboard widget

Without quantity truth, partial order recovery, supervisor stockout prevention and predictive ops stay reactive. Unanimous in store visits; #1 OPS workshop future bet pairs with scan-to-activate and copilot.

Coverage: MX 4/4 CDMX · PE 3/3 · SL vision · PE workshop · *Layer:* Portfolio · *Countries:* Mexico, Peru

UX roadmap IDs: portfolio-quantity, portfolio-unified, metrics-ai-mvp

Suggestion: Quantity MVP with optional auto-decrement. Supervisor alerts before stockout. Scan supplier invoice → activate SKUs. Unlocks partial orders and fair dispatch.

Owners: PM Seller · OPS · Data

- PE Service Level (Sep 1): inventory real-time = strategic gap — Power BI + WhatsApp workaround
- MX CDMX unanimous #1 — Los Alpes 'top priority'
- PE workshop OPS future #2: stock activation via receipt scan + copilot
- PE workshop OPS challenge #1: real-time KPI visibility includes stockout risk

#16 · High · Predictive ops cockpit — from corrective WhatsApp to real-time KPIs

Supervisors answer WhatsApp on Sunday 4pm; sellers wait until 9pm for ops dashboard. OPS workshop #1 vote: live stock, SLA, availability, hot products, courier dotation.

Coverage: MX OPS workshop · PE 3/3 · PE workshop OPS #1 · *Layer:* Metrics · *Countries:* Mexico, Peru

UX roadmap IDs: admin-kpi-cockpit, metrics-hourly, metrics-ai-mvp

Suggestion: Resume Power BI cockpit per POC in seller platform. Hourly orders + couriers heatmap. AI explains opaque ranking. Alert before SLA breaks.

Owners: PM Seller · OPS · Data

- PE workshop OPS: weekend monitoring via WhatsApp — want copilot/automation
- MX OPS (Daniela/John): 'summary where we can see real time... SLA, free rate'
- MX OPS (Luis): Armis/Vitex — store code, live inventory per POC
- PE WebPO: weekly Mon–Sun KPIs praised — partial homologation target

#17 · High · Claims & compensation triangle — CX, store and consumer not connected

Zendesk → store email takes days. Compensation only if customer contacts support. OPS workshop #3 priority. Deposit disputes drive 1-star when no seller channel.

Coverage: PE workshop OPS #3 · PE 3/3 · MX CX · *Layer:* Communication · *Countries:* Peru, Mexico

UX roadmap IDs: cx-fast-seller-channel, cx-unified-seller-view

Suggestion: Faster credits/refunds like market best practice. Unified seller view for CX. Structured cancellation + dispute reasons visible to all parties.

Owners: PM CX · OPS · PM Seller

- PE workshop: parallel email chain — CX, store, consumer not triangulated
- PE La Marina: 4–5 of 50 orders bottle disputes → 1-star
- MX CX: ~40% tickets are coordination
- PE Service Level: timed traceable messaging for wrong address + no-answer

#18 · High · Data stack fragmentation — AppsFlyer, MMP, Segment not homologated

Consumer workshop #2: attribution and funnel data inconsistent across tools. Blocks personalization, CRM triggers and ROI measurement for growth.

Coverage: PE workshop Consumer #2 · *Layer:* Growth · *Countries:* Peru

Suggestion: Homologate event taxonomy across AppsFlyer, Segment and Braze. Enable category/user-based merchandising. Foundation for personalization and football occasion APIs.

Owners: Growth · Data · PM Consumer

- PE workshop Consumer: AppsFlyer/MMP integration voted #2
- PE workshop: static cross-sell carousel — can't customize by category or history
- Promo workshop MX: no real-time dashboard to adjust active mechanics

#19 · High · Loyalty stack gaps — Braze, flash coupons, BEES admin, anti-fraud

Rewards workshop top 4: Club TaDa × Braze enrichment, flash coupons in wallet, rewards admin in BEES, anti-fraud automation. Tiers and omnichannel are 3–4 year horizon.

Coverage: PE workshop Rewards · EC Oct 8 #1 vote (4) · *Layer:* Loyalty · *Countries:* Peru, Ecuador

UX roadmap IDs: notification-center

Suggestion: Ship flash coupon mechanics + wallet UX together. Centralize rewards config in BEES. Braze triggers for occasion (football, birthday). Fraud rules before scaling earn/burn.

Owners: Rewards · PM Consumer · Commercial

- PE workshop Rewards #1: Braze enrichment for Club TaDa
- PE workshop #2: flash coupons — wallet UX also Consumer #4
- PE workshop #3: BEES-integrated rewards admin
- PE workshop #4: anti-fraud automation — SED Turbo 5% orders fraud risk
- EC Oct 8: Club TaDa native integration — top workshop vote; external platform blocks CX; year-end migration target
- EC Oct 8: sampling CSV loads fail in prod; live promo counters (order #100) voted (2)

#20 · High · Ecosystem communication — seller, courier, consumer, CX still siloed

Service Level vision umbrella: Brace for OPS→store comms, delivery proof code, quantitative picker. Same root as WhatsApp workaround everywhere.

Coverage: PE SL vision · MX CX · both countries 3/3+ · *Layer:* Communication · *Countries:* Mexico, Peru

UX roadmap IDs: in-app-chat-seller, notification-center, cx-predefined-messages

Suggestion: Pilot pre-defined messages (MX+PE). Brace for ops campaigns. Notification center homologation. In-app chat as phase 2 once reliability fixed.

Owners: PM CX · PM Seller · PM Courier

- PE SL: Ecosystem Communication = umbrella for all contact layers
- PE SL: Brace centralizes OPS→store with training/campaigns tooling
- MX notification center pilot Bolivia → LATAM homologation
- 100% WhatsApp in every country visited

#21 · Medium · Promo ops fragmented — Excel, Trello, VTEX, consumer app out of sync

Commercial runs promos across disconnected tools. Field visits show consumer sees promo before seller can stock. Peru Stella in app but not BEES.

Coverage: MX Promo workshop · PE 2/3 · Puebla 3/5 · *Layer:* Commercial · *Countries:* Mexico, Peru

UX roadmap IDs: notification-center, admin-sku-promo-protection

Suggestion: Centralized promo calendar with 7-day seller notice. Flash promo module. Link calendar → seller notification → supply slots. Category/brand-level config.

Owners: Commercial · PM Seller · OPS

- Promo workshop: Excel + Trello + VTEX fragmentation
- MX Forjadores: Corona 30→50% World Cup, 250 cartons, still stockout
- PE La Marina: Stella promo in consumer app but not BEES
- PE workshop OPS #4: SKU restrictions on coupons reduce promo errors

#22 · Medium · 2028 bets converging — vending, football, omnichannel, partnerships

Workshop future vision: OPS wants scheduled orders + vending + OXXO/Tambo; Consumer wants virtual returnables + personalization; Rewards wants football earn/burn + omnichannel redemption.

Coverage: PE workshop all groups · EC Oct 8 dreams · Momento Inesperado · *Layer:* Loyalty · *Countries:* Peru, Ecuador

Suggestion: Sequence after Q1–Q2 foundations: football MVP via Braze, Tambo omnichannel pilot, vending/partnership discovery. Tiers 3–4 year horizon.

Owners: Product · Rewards · OPS · Partnerships

- PE OPS future #1: scheduled orders + vending machine pickup
- PE Rewards future #1: football occasion earn/burn + API
- PE Consumer future: virtual returnables + pickup
- Momento Inesperado: football kit near canchita, birthday DJ, first Club beer
- EC Oct 8 dreams: subscription/TaDa premium (4), split pay Círculos, scheduled delivery, mundialito dark stores
- EC Oct 8 telão: birthday free order, meet football player, top courier recognition cross-country

#23 · High · Returnables / RGB — consumer doesn't understand exchange rules

44% of Peru orders include RGB but awareness is price-driven, not education. Cross-brand bottle swap unclear; Retornafest window missed. Brand page path agreed for education landing.

Coverage: PE Sep 3 P1 · Consumer workshop returnables · *Layer:* Growth · *Countries:* Peru

Suggestion: Ship returnables education on brand page + category header. Coordinate next campaign window with Growth.

Owners: PM Consumer · Peru Growth · Commercial

- PE Consumer vision P1: Tengo/No tengo tags confuse consumers
- PE 44% RGB order share vs Rappi moat — education gap
- Brand page + multishowcases agreed; Retornafest Sep missed

#24 · High · CX chatbot — not tropicalized for Peru

~45% deflection but AI stale ~2 years; no human handoff. Bot asks country/phone already known. Service-design scope requested beyond bot-only.

Coverage: PE Sep 3 P1 · *Layer:* Growth · *Countries:* Peru

UX roadmap IDs: cx-decision-tree, cx-predefined-messages

Suggestion: Tropicalize flows + human escalation. Pair with ecosystem comms for coordination tickets.

Owners: PM CX · Peru Growth

- PE Consumer vision P1: tropicalization gap
- Diego/Helio discovery started — not bot-only fix
- MX CX benchmark: decision tree + predefined messages

#25 · High · Coupon wallet UX + lifecycle — manual clusters, flash burn missing

Monthly manual lifecycle coupons; wallet shows last-created first. Rewards wants flash countdown coupons; Club TaDa migration path for create/order/segment.

Coverage: PE Consumer wk #4 · Rewards wk #2 · Sep 3 P2 · *Layer:* Growth · *Countries:* Peru

UX roadmap IDs: notification-center

Suggestion: Redesign wallet UX. Ship flash burn mechanics with Club TaDa admin — 30-day validity migration.

Owners: Rewards · PM Consumer · Growth

- PE Consumer workshop #4: wallet UX + Club ordering
- PE Rewards workshop #2: flash coupons not built
- PE Growth P2: lifecycle clusters manual per month

#26 · High · Online payments blocked — Peru 3% share, Ecuador gateway off after fraud

Peru online pay share only 3% on a sole gateway; Ecuador turned payments off after card cloning without OTP/3DS — COD dominates, cancel penalties and split-pay dreams fail. BIN campaigns and orchestrator expansion stall in both markets.

Coverage: PE Consumer workshop #3 · Sep 3 P3 · EC Oct 7–8 (Critical on workshop board) · *Layer:* Growth · *Countries:* Peru, Ecuador

Suggestion: Expand payment orchestrator country-by-country. Enable BIN partnerships for acquisition.

Owners: Fintech · PM Consumer · Growth

- PE Consumer workshop #3: BBVA/BCP-style BIN promos
- PE Consumer vision P3: Nube dependency
- Fish Promo digitization blocked without payment diversity
- EC Oct 7: gateway off after card-cloning fraud — cash-on-delivery only despite user expectation of digital pay
- EC Oct 8: no OTP/3DS on stored cards → chargebacks; cancel penalties need online pay — cash penalty never collected
- EC Oct 8 dreams: split pay (Círculos), wallet cashback — all gated on payment rails

#27 · Medium · Multishowcases + Buy Again — product ship track vs field gaps

Sep 3: multishowcases Sep 15 target, Buy Again 98% ATC / 61% conversion. Gaps remain: map, returnables, partial order, data stack — ship track ≠ field readiness.

Coverage: PE Consumer vision Sep 3 · *Layer:* Growth · *Countries:* Peru

Suggestion: Prioritize Peru rollout sequence with Growth. Don't ship all features at once — map + address first.

Owners: PM Consumer · Victoria/Fernando · Peru Growth

- PE product demo: 12+ features on roadmap
- Buy Again beats category conversion in Mexico reference
- Growth 18 pains — 6 P1 still open

#28 · High · Community POC hybrid — legal pilot before territorial leap

Ecuador plans 112 Community POCs alongside 28 dark stores (6→41 cities, coverage 42%→67%) but cannot run POP pricing in-app today — pilot + regulation first.

Coverage: EC Oct 7 prep · aligns with CO/MX seller landing · *Layer:* Growth · *Countries:* Ecuador

Suggestion: Ship seller acquisition landing when GO. App workflow for POP reference prices. Keep dark stores for service control in core cities.

Owners: Ecuador expansion · PM Seller · Legal

- EC: 100% dark store today; hybrid doubles orders in model vs LE26
- EC: legal blocks Community POC tooling — reference price workflow needed
- EC: coast/insecurity (Guayaquil) — Community POC to attack competition zones

#29 · High · Motorizado locked to first POC — slow reassignment

After Vitex migration, one courier account binds to one store. Store closure or city move needs ticket + delete — ops pain at scale.

Coverage: EC Oct 7 · legal/third-party rule · *Layer:* Peak ops · *Countries:* Ecuador

Suggestion: Legal review of third-party rules; self-serve POC transfer without multi-homing.

Owners: Courier product · Legal · OPS

- EC Cindy: motorizado cannot register in second POC without back-office removal
- Product: not parallel multi-store — fast transfer when POC closes

#30 · Medium · CRM holdout discipline — prime slots drive incrementality

Ecuador runs holdout tests on pushes: Fri 18h +50%, Sun 12h +40%; mornings ~+5%. Checkout incoherence (fee promise) kills lift.

Coverage: EC CRM W40 deck · Oct 7 · *Layer:* Commercial · *Countries:* Ecuador

Suggestion: Homologate holdout playbook to MX/PE. Fix promo/checkout coherence before scaling pushes.

Owners: CRM · PM Consumer · Growth

- EC: Chelizza ≥$30 lifts ticket +$8.40 vs control
- EC: Sat 20h fee glitch push +3.3% — neutral vs control
- EC: hyper-personalization by purchase history in Braze

#31 · Medium · One DDC per POC — granularity win at small scale

Ecuador moved from shared DDC (5–6 POCs) to one per store — stockout 0.8% with centralized supply. Promo Excel per 23 POCs; regroup when density rises.

Coverage: EC Oct 7 · same play as PE portfolio granularity · *Layer:* Portfolio · *Countries:* Ecuador, Peru

Suggestion: Productize per-POC promo templates (not only Excel). Plan DDC regrouping rules before Community POC scale.

Owners: OPS · PM Seller · Commercial

- EC Majo: DDC per POC improved indicators vs shared regional DDC
- EC: incentive if stockout <2% (~15¢/order)
- Risk at 500 POCs: merge DDCs when consumer behavior converges geographically

#32 · Critical · Club TaDa integration — Ecuador workshop #1 vote

Managing loyalty on an external platform is the top near-term bet (4 votes). Sampling, refunds visibility and CRM triggers stall until Club lives natively in the app.

Coverage: EC Oct 8 workshop · PE Rewards stack · *Layer:* Loyalty · *Countries:* Ecuador, Peru

UX roadmap IDs: notification-center

Suggestion: Ship EC Club migration on critical path. Pair with wallet UX and sampling catalog rules before scaling gamification (Braze Tadi, promo counters).

Owners: Rewards · CRM · PM Consumer

- EC Oct 8: Club TaDa integrated — 4 votes (highest on challenges board)
- EC Oct 7: Club in weekly CRM planning; hyper-personalization in Braze already
- EC Oct 8: auto-configured free gift / sampling broken — 2 votes each

#33 · High · Profile edit + map geo — first-order trust (Ecuador)

Users cannot fix phone, address or email without ticket or account deletion — first-order cancel spike. Mall/landmark search resolves to wrong cities; quick confirm on distance warning locks bad pins.

Coverage: EC Oct 8 workshop · PE ~18% wrong-address pattern · *Layer:* Growth · *Countries:* Ecuador, Peru

UX roadmap IDs: cx-decision-tree, cx-consumer-visibility

Suggestion: Self-serve profile edit + address confirmation flow. Tune map layers and force pin adjust before lock-in. Brazil location UX rollout candidate.

Owners: PM Consumer · Growth · Design

- EC Oct 8: profile edit anytime — 2 votes; NPS hit on first order
- EC Oct 8: Guayaquil mall → San Marino Quito pin; secondary-street layer too coarse
- EC Oct 8: remind user not at delivery address — 2 votes
- PE Sep 3: wrong address / no-answer ~18% cancellations

#34 · High · Cancel after dispatch — courier paid per delivery only (Ecuador)

When the consumer cancels after POC assigns a rider, courier NPS drops — EC pays per completed delivery, not per attempt. Penalties need online payment; cash at door fails.

Coverage: EC Oct 8 workshop · MX/PE cancel pain · *Layer:* Peak ops · *Countries:* Ecuador

UX roadmap IDs: cx-consumer-cancellation, cx-predefined-messages

Suggestion: Status-based cancel policy with card-on-file penalties. In-app messaging when rider en route. Align with payment orchestrator re-enable.

Owners: PM Consumer · Courier · OPS

- EC Oct 8: 100% pay per delivered order — mid-route cancel hurts motorizado
- EC Oct 8: fee + messaging once rider assigned — linked to payment gateway off
- EC dreams: automated cancel rules with penalty after dispatch

#35 · High · Admin rules in-app — delivery bands, rain, tips, service fee (Ecuador)

Flat ~$1.500 delivery whether 5 or 30 minutes; no service fee; rain surge manual. Luis wants POC-to-POC fee grids without CSV typos.

Coverage: EC Oct 8 · EC Oct 7 admin pain · *Layer:* Commercial · *Countries:* Ecuador

UX roadmap IDs: admin-sku-promo-protection, admin-kpi-cockpit

Suggestion: Replace fragile CSV with validated admin UI for fees by POC and distance. Tie rain/event surcharges to MotoGP-style peak playbook.

Owners: Admin product · OPS · Ecuador commercial

- EC Oct 8: CSV → dynamic admin — delivery by distance band, tips, rain surcharge
- EC Oct 8: Excel human error — wrong cell price in fee upload
- EC Oct 7: payment method change at customer door still manual

#36 · High · POC supervisor cockpit — BizWam visibility + assign assist

Supervisors lack live delayed/cancelled board; POCs copy order codes to Excel for cash close. Workshop voted assign recommendations and dreams full seller health in BizWam.

Coverage: EC Oct 8 votes · EC Oct 7 Power BI FOR · *Layer:* Peak ops · *Countries:* Ecuador

UX roadmap IDs: admin-kpi-cockpit, metrics-ai-mvp

Suggestion: Supervisor alert board (delayed, cancel, city/match day). POC dispatch assist by order cluster. Downloadable close-of-day order export.

Owners: PM Seller · OPS · Data

- EC Oct 8: POC assign-order recommendations — 2 votes
- EC Oct 8 dreams: BizWam supervisor command center (3 votes); AI geofence staffing alerts
- EC Oct 8: export order list for cash close — manual code-by-code copy
- EC Oct 7: seller home KPI page unused; FOR calculators on WhatsApp

#37 · Medium · Promo catalog weight — variant SKUs + ERP inventory dreams

Color-choice bundles need 7–8 SKUs without variant picker; app heavy. Dreams vote SAP/Dynamics for trustworthy MB and automated reconciliation.

Coverage: EC Oct 8 Consumer + dreams vote · *Layer:* Portfolio · *Countries:* Ecuador

UX roadmap IDs: portfolio-unified

Suggestion: Variant picker under parent SKU. Long-term ERP feed for theoretical stock — align with quantity MVP and Community POC scale.

Owners: PM Consumer · Commercial · OPS

- EC Oct 8: thermos color forces duplicate SKUs — discovery suffers
- EC Oct 8 dreams: ERP (SAP) + reliable inventory MB — 3 votes
- EC Oct 8: step discount helped but catalog still bloated

#38 · High · Motorizado forecast in Excel — BEES export not in platform (Ecuador)

Supervisors build couriers-needed/hour from BEES raw data and share on WhatsApp; MotoGP reacts manually. Same class of pain as opaque 7-day KPIs and PE WebPO workaround.

Coverage: EC Oct 7 prep · aligns with rank #7 · *Layer:* Metrics · *Countries:* Ecuador, Peru, Mexico

UX roadmap IDs: admin-b2b-courier-forecast, forecast-trust, metrics-hourly

Suggestion: Ship trusted forecast + staffing view per POC in seller/admin; homologate PE WebPO heatmap patterns.

Owners: PM Seller · OPS · Data

- EC Oct 7: Excel motorizado forecast from BEES — team wants automation like other markets
- EC MotoGP: gamification closes gaps when forecast misses
- MX Zavaleta: orders/hour + couriers/hour still manual Excel

#39 · Critical · Puebla Project — parallel-email loop & store non-response

CX waits days when POCs ignore parallel threads; supervisors not always CC'd; financial and short-ship cases stall — drives churn and 'estafa' perception.

Coverage: Puebla Project · 10 transcripts · Rota CX · *Layer:* Communication · *Countries:* Mexico

UX roadmap IDs: cx-fast-seller-channel, cx-unified-seller-view, cx-delivered-not-received

Suggestion: SLA-tracked seller↔CX channel with supervisor visibility; delivery proof + mandatory cancel reasons.

Owners: PM CX · OPS

- Puebla cross-theme #1: no tenemos respuesta del punto de venta
- Abasto never answered parallel email; client 'pidió a gritos auxilio'
- Ties to ~40% coordination tickets in MX CX meeting

#40 · High · Turbo / BEES reliability — alerts, refresh, store on/off desync

Tablet alarms missed with floor audio; silent notifications; multi-tab refresh → expired orders; turbo geofence and UI bugs during rollout.

Coverage: Puebla Project · Cholula · Buenavista · Periférico · *Layer:* Reliability · *Countries:* Mexico

UX roadmap IDs: order-alert-session, courier-order-push, map-assign-stay

Suggestion: Layer 1 reliability before turbo scale: sound, session, single peak surface, status sync.

Owners: PM Seller · OPS

- Puebla: 'con tablet la operación es peor'; store shows off while orders flow
- Turbo 1 km geofence + polygon export gaps; grouping priority bugs
- Same peak reliability stack as CDMX rank #1

#41 · Medium · POC incentive & reimbursement visibility (Ecuador)

Variable-heavy Ecuador model; weekly summary insufficient — POCs want daily view of incentives tied to stockout and dispatch KPIs.

Coverage: EC Oct 7 prep · *Layer:* Metrics · *Countries:* Ecuador

UX roadmap IDs: reimbursement-breakdown, financial-report-date-filter

Suggestion: Line-by-line weekly + daily incentive drill-down on seller platform — mirror WebPO/Jumbo pattern.

Owners: PM Seller · Finance · OPS

- EC Oct 7: ~15¢/order if stockout <2% — hard to audit daily
- EC: daily visibility of all incentives 'would be super good'

#42 · Medium · Live promo counters + auto free-gift config (Ecuador workshop)

Ecuador runs split campaigns (order #100, #1000) without in-app progress; auto-configured free-gift SKUs tied to sampling loads — both voted (2 each) on Oct 8 Rewards board.

Coverage: EC Oct 8 OYP workshop · ties to rank #32 sampling · *Layer:* Commercial · *Countries:* Ecuador

UX roadmap IDs: notification-center, admin-sku-promo-protection

Suggestion: Ship promo progress UI (deadline + units remaining) with Club migration. Fix country catalog rules for sampling/free-gift before scaling Braze gamification.

Owners: Rewards · PM Consumer · Commercial

- EC Oct 8: live visual for promo counters — 2 votes
- EC Oct 8: auto-configured free gift products — 2 votes
- EC Oct 8: sampling CSV never surfaces gift SKUs despite 10k-row loads
- EC Oct 7: flash promo hard on/off windows (3x2 until 12:00) — ops scheduling

#43 · Medium · Hospitalidad telão — birthday, football, recognition (Ecuador)

Oct 8 hospitality ideation: surprise birthday gifts, sponsor football meetups, cross-country top-store/courier recognition, dark-store mundialito — differentiation beyond transaction efficiency.

Coverage: EC Oct 8 workshop telão · Momento Inesperado thread · *Layer:* Growth · *Countries:* Ecuador

Suggestion: Sequence on CRM identity + inventory truth. Pilot one hospitality play per quarter with measurable repeat — not before Layer 1 reliability.

Owners: CRM · Growth · OPS

- EC Oct 8: birthday order free / multi-day social occasions
- EC Oct 8: meet football player via CN sponsor deals
- EC Oct 8: welcome kit new stores; top-200 courier coupon pride moment (BR reference)
- EC Oct 8 dreams: subscription tiers + scheduled delivery for match time

#44 · Critical · BEES off while store has stock — ERP not integrated (Colombia)

Colombia's SIESA/BEES disconnect created false stockouts (bottle vs liquid, SKU off in BEES). Commercial invented availability scoring + store ranking + pay — same inventory-truth class as MX/PE/EC quantity MVP.

Coverage: CO Sep 13 product intro · allies + own stores · *Layer:* Portfolio · *Countries:* Colombia, Mexico, Peru, Ecuador

UX roadmap IDs: portfolio-quantity, portfolio-filters

Suggestion: SKU-level truth in seller/BEES; optional ERP feed for high-volume Community POC allies.

Owners: PM Seller · OPS · Commercial CO

- CO: BEES and SIESA not integrated — biggest local pain
- CO: penalize stores that have product but keep SKU off in BEES
- MX/PE/EC: quantity toggle without units — orders on 'off' SKUs

#45 · Critical · Marketplace acquisition changes retention — night buyers & AOV bands (Colombia)

~30% of beer-paid acquisition lands marketplace-only carts. Marketplace users repurchase every 22–30 days vs 12–14 for beer; poor retention when AOV <50k or >120k COP — CRM timing and tiers must split journeys.

Coverage: CO Sep 13 growth · parallels EC promo/catalog weight · *Layer:* Growth · *Countries:* Colombia

UX roadmap IDs: notification-center

Suggestion: Separate lifecycle for marketplace vs beer; night comms windows; monitor blended CAC vs M1/M3 retention by entry promo.

Owners: Growth CO · CRM · PM Consumer

- CO: cannot message marketplace users at 4pm like beer cohort
- CO: new marketplace cluster — low/high AOV bands churn
- CO: marketplace share higher than beer in some zones

#46 · High · Bank partnerships — cheap CAC, fragile retention (Colombia)

10–15% of users via banks at ~$2–3 CAC (blended ~$5–6). BIN/datáfono reporting proves value; big 50% promo spiked users then churned when media paused. In-app story for bank benefits missing; 2026 shift to retention (double points).

Coverage: CO Sep 13 · PE BIN / EC payment rails · *Layer:* Growth · *Countries:* Colombia, Peru

Suggestion: Wallet + partnership UX in app; retention KPIs on bank cohorts; align with payment orchestrator roadmap.

Owners: Growth CO · Fintech · CRM

- CO: partnerships #1 growth win — retention weaker post-promo
- CO: Lucho — partnerships for retention not only acquisition
- PE: BIN campaigns blocked without orchestrator (rank #26)

#47 · High · Own stores vs Community POC — dual paypoints & data access (Colombia)

~80% orders still on ~69 own stores vs ~120 aliados; allies lack Power BI/cluster access — Top Tiendas + ops bridge. Paypoints and owner change differ from EC Community POC / PE third-party scale plays.

Coverage: CO Sep 13 expansion · EC hybrid POC · *Layer:* Peak ops · *Countries:* Colombia, Ecuador, Peru

UX roadmap IDs: admin-kpi-cockpit, metrics-ai-mvp

Suggestion: Two seller personas in one country — homologate KPI/stockout dashboards per model; Top Tiendas pattern for data-poor allies.

Owners: OPS CO · PM Seller · Expansion

- CO: Community POC capillarity — orders fed from own stores
- CO: only own stores on SIESA; allies use many ERPs
- EC Oct 7: Community POC legal + seller landing

#48 · High · Store-off alerts, overlap & manual Torre de Control (Colombia)

When a Community POP turns off, cannot auto-cover full zone — planned overlap (3–4 stores/consumer). Weekend Torre de Control (2 people) + WhatsApp red alerts for unique-zone offs — same spillover pain as MX rank #4.

Coverage: CO Sep 13 ops · MX overlap · Puebla BEES off · *Layer:* Reliability · *Countries:* Colombia, Mexico

UX roadmap IDs: admin-polygon-neighbor, notification-center

Suggestion: Proactive off-store alerts to ops/supervisors; overlap rules in admin; reduce WhatsApp-only weekend watch.

Owners: OPS CO · PM Seller · Data

- CO: need alarm when stores turn off — not map-watching only
- CO: mid-zone fallback when aliado off — not full auto-spillover
- MX: neighbor SKU off → volume floods one POC

#49 · High · Stockout metric — SKU line at 90%, not category only (Colombia)

Power BI category stockout + ally 90% gate works; extended SKU portfolio tool is external. Product ask: per-SKU stockout bar in BEES/seller like commercial minimum threshold.

Coverage: CO Sep 13 · rank #3 quantity thread · *Layer:* Portfolio · *Countries:* Colombia

UX roadmap IDs: portfolio-quantity, portfolio-filters

Suggestion: Ship SKU-level stockout visibility before expanding ally count (~double Community POC plan).

Owners: PM Seller · Commercial CO · Data

- CO: ideal stockout for every SKU in platform
- CO: allies now have orders — enforce 90%+ minimum
- CO: minimum portfolio vs extended SKU list measured separately

#50 · High · Club TaDa staffing gap + algorithmic For You shelves (Colombia)

Club program understaffed; Lovers base down; automated missions postponed. Colombia wants For You fully algorithmic — blocked by SEM single-hero layout vs flexible sampling.

Coverage: CO Sep 13 rewards/product · EC Club vote #32 · *Layer:* Loyalty · *Countries:* Colombia, Ecuador, Peru

UX roadmap IDs: notification-center

Suggestion: Stabilize Club ops; unblock showcase rotation (sampling/SEM policy); tie to Braze missions when staffed.

Owners: Rewards · PM Consumer · Growth CO

- CO: month without Club owner — missions delayed
- CO: dream — For You 100% algorithmic, not one manual showcase
- EC Oct 8: Club TaDa integration #1 vote

#51 · High · Billing API & order export — e-invoicing compliance (Colombia)

Mandatory e-invoicing; order data lost after accept; manual discounts → control audit risk. Prefer documented billing API + CSV export over 40 ERP integrations if sellers keep using platform — Zé lesson.

Coverage: CO Sep 13 · PE reimbursement transparency · *Layer:* Metrics · *Countries:* Colombia

UX roadmap IDs: reimbursement-breakdown, financial-report-date-filter

Suggestion: Order line export at accept + billing API; prioritize adoption metrics on aliado stores.

Owners: PM Seller · Finance · Legal CO

- CO: when store accepts, user billing data is lost
- CO: Zé built ERP integrations but stores stopped using product
- CO: discounts manual — open door to billing errors

Convergences

- Peak tooling failure is hemispheric: refresh/GPS/silent logout/no sound → same outcome — expired orders and dispatch SLA damage
- Inventory quantity is unanimous where asked; combo/search pain is universal — Peru and Mexico want compose-from-two-SKUs
- Inventory real-time is the strategic unlock (Sep 1 SL vision) — partial orders, supervisor view, stockout prevention, scan-to-activate
- WhatsApp is the real ops layer in every country visited — product must replace it with audit trail, not compete on speed alone
- Dispatch SLA (10 min) conflicts with courier staffing reality — sellers ready early, rider late; metric punishes the wrong party
- 7-day KPI window insufficient everywhere — Peru built WebPO weekly view as workaround; Mexico sellers use Excel; OPS workshop #1 wants predictive cockpit
- Inter-POC spillover when neighbors disable SKUs — Merino (+70 orders) mirrors Forjadores absorbing Puebla neighbors
- Promo consumer visibility ≠ seller/supply readiness — Stella S/23 in app but not BEES is the Peru version of World Cup Corona desabasto
- Promo planning fragmented (Excel/Trello/VTEX) — commercial workshop + field visits demand single calendar → seller notification → supply
- Returnables and cold chain are strategic (Peru vs Rappi) but infra lags promo volume (cartons, 28-packs, ice)
- Local OPS innovation (Peru WebPO) shows the bar for seller trust — reimbursement breakdown, hourly demand, weekly KPIs
- Ecosystem Communication is the umbrella (Sep 1): Brace + delivery proof + predefined messages — same pain as MX CX ~40% coordination tickets
- Claims triangle broken (Sep 2 OPS): Zendesk → email → days; compensation only if customer escalates — market expects instant credits
- Consumer data stack not homologated (Sep 2): AppsFlyer/MMP/Segment blocks personalization and football occasion APIs
- Rewards stack needs Braze + wallet + BEES admin + anti-fraud before tiers/omnichannel scale (Sep 2 Rewards workshop)
- Future bets align across groups: scheduled orders + vending (OPS), virtual returnables (Consumer), football earn/burn (Rewards)
- Momento Inesperado hospitality — football kit, birthday experiences, first Club order — needs CRM triggers + inventory + logistics foundation first
- MX OPS workshop (Jul 23) + PE OPS workshop (Sep 2) vote same top themes: real-time visibility, admin console, polygon/coverage, coupon SKU rules
- Courier supervision panel (MX Andre) = live map (PE Consumer #1) = CX blind spot — one map layer serves all actors
- Consumer vision Sep 3: multishowcases + Buy Again (61% conversion) on ship track; returnables education, courier map bugs and ~18% wrong-address cancels remain top commercial gaps
- Buy Again shelf beats categories in conversion (98% ATC, 61% order) — Peru/Mexico signal for personalization priority

- Admin simplification (discounts, shelves, manual pricing) high OPS load but deprioritized vs consumer — automate via copilot in 2027 H2
- Research confirms the missing actor: seller and courier handoff turns one failure into stockout, waiting, late ETA, cancellation and support cost
- Small in discovery needs activation; Large anchor needs protection — seller volume is not a maturity score
- Courier satisfaction can remain high while communication, route and wait friction erode time and earnings
- Lovers Plus is an operating benchmark: 92% Perfect Orders and 48% SLA15 vs 35% Core
- Competitive benchmark expands the map: Rappi is regional; Uber is a Mexico ecosystem threat; PedidosYa is a Peru density/fintech threat
- Ecuador Oct 7: hybrid Community POC + dark store is the growth bet — product must unblock POP pricing, seller landing and suggested replenishment before scale
- Payment gateway trauma in Ecuador mirrors Peru low online share — fraud controls must precede marketing promises on fees and BIN campaigns
- CRM holdout + occasion calendar (Chelizza, BEERFEST, Clásico) shows Ecuador ready for Rewards workshop — Club TaDa already in weekly planning
- MotoGP + Power BI FOR = local OPS innovation when seller home metrics unused — same bar as Peru WebPO
- Ecuador Oct 8 workshop: single board proved Consumer/SL/Rewards pains are one handoff — Club (4), POC qty (2), profile edit (2), messaging (2)
- Excel/CSV is Ecuador's hidden OS — stock Pareto, admin fees, cash close, sampling loads, courier forecast
- Ecuador cancel-after-dispatch exposes pay-per-delivery economics — penalties require online pay, not cash at door
- Ecuador hospitality telão (birthday, football, recognition) aligns with Momento Inesperado — needs CRM + inventory foundation
- Ecuador dreams vote ERP/SAP + BizWam cockpit — same long arc as Peru real-time inventory vision and MX admin console ask
- Puebla Project confirms MX coordination pain at scale: parallel-email loops, BEES desync, and turbo rollout need the same Layer 1 stack as CDMX/PE peaks
- Motorizado forecast in Excel (EC) + WebPO heatmap (PE) + Zavaleta hourly sheet (MX) — one staffing/forecast UX should homologate across markets
- Fulfillment integrity (short ship, fake delivered, static codes) in Puebla links to delivery proof code and CX visibility items on the UX roadmap
- Colombia Sep 13: BEES↔ERP availability score proves inventory truth moves conversion — same bet as quantity MVP in MX/PE/EC (rank #44)
- Colombia marketplace + bank promos changed who enters — retention and CRM timing must split beer vs marketplace (rank #45–46)
- Colombia own-store vs Community POC dual model — Top Tiendas + billing API are ally adoption plays, not only integration (rank #47, #51)
- Colombia Torre de Control + store-off WhatsApp alerts — weekend manual ops layer like MX spillover until product alerts exist (rank #48)

Themes by area

Operations

Sources: MX OPS Jul 23 · PE visits · PE SL Sep 1 · PE workshop Sep 2 · EC Oct 7–8 · CO Sep 13 · Puebla Project

- Real-time KPI visibility — stock, SLA, availability, courier dotation (PE workshop #1)
- Peak reliability — sound, session, map freeze, expired orders (MX+PE unanimous)
- Claims triangle slow — Zendesk → email → days (PE workshop #3)
- Admin console like Armis/Vitex — enter by store code, live inventory (MX Luis)
- Polygon/coverage manual — dangerous zones, spillover when neighbor disables SKU
- Manual pricing/discount load — DDC, Diageo, PDV (PE workshop)
- Weekend monitoring via WhatsApp — want copilot/automation
- EC Oct 8: live POC stock qty (zero/infinite); POC assign recommendations; Excel cash-close export
- EC Oct 8: BizWam supervisor board + AI geofence staffing — dreams vote
- EC Oct 8: cancel after dispatch vs pay-per-delivery courier model
- Puebla Project: BEES alerts, turbo geofence, tablet refresh → expired orders (rank #40)
- EC Oct 7: motorizado forecast Excel + WhatsApp (rank #38)
- CO Sep 13: store-off overlap + Torre de Control weekend map watch (rank #48)
- CO Sep 13: own vs Community POC — 80/20 orders, Top Tiendas bridge (rank #47)

Consumer

Sources: PE workshop Sep 2 · PE consumer vision Sep 3 · PE context · MX field visits · EC Oct 8 OYP workshop · CO Sep 13

- Live courier map — Consumer workshop #1 + Sep 3 Growth P1 (pin frozen) — same as MX Andre supervision panel
- Returnables/RGB education — 44% order share PE; brand page + Retornafest missed window (Sep 3)
- Multishowcases + Buy Again — product roadmap Sep 15 target; 61% conversion beats categories
- AppsFlyer/MMP/Segment homologation — blocks personalization (workshop #2)
- Payment gateways + BIN bank promos (workshop #3)
- Coupon wallet UX + flash coupons (workshop #4, converges with Rewards)
- Wrong address + no-answer cancellations (~18% PE)
- Static cross-sell — can't customize by category or history
- Virtual returnables + pickup — future vision
- EC Oct 8: profile edit + map landmarks; consumer ↔ courier messaging (voted)
- EC Oct 8: payment gateway off — fraud blocks cancel fees and split pay dreams
- EC Oct 8 telão: birthday, football, recognition — rank #43
- CO Sep 13: marketplace night buyers + AOV bands — rank #45
- CO Sep 13: bank partnerships CAC vs retention — rank #46
- CO Sep 13: algorithmic For You vs SEM/sampling — rank #50

Rewards

Sources: PE workshop Sep 2 · PE context meeting · EC Oct 8 OYP workshop · CO Sep 13

- Club TaDa × Braze enrichment (workshop #1)
- Flash coupons in wallet (workshop #2)
- Rewards admin integrated in BEES (workshop #3)
- Anti-fraud automation — SED Turbo risk (workshop #4)
- Football occasion earn/burn — future #1
- Omnichannel redemption at Tambo/convenience — future #2
- Tiers + brand-occasion correlation — 3–4 year horizon
- EC Oct 8: Club TaDa native integration — #1 vote (4); sampling broken; live promo counters
- EC Oct 8: auto free-gift config + live promo counters — rank #42
- EC Oct 8: Braze gamification + subscription premium — dreams vote

Commercial & promos

Sources: MX Promo workshop Jul 21 · MX Puebla · PE context · EC Oct 7 CRM · EC Oct 8 workshop · CO Sep 13

- Excel + Trello + VTEX fragmentation — no single source of truth
- Consumer promo before seller can stock — World Cup Corona, Stella/BEES gap
- Flash promo mechanics — quantity vs discount types
- Bulk upload errors and manual margin calculations
- No real-time promo ROI dashboard
- 7-day seller notice + supply slot alignment missing
- EC: flash promo hard on/off windows (3x2 until 12:00) — ops-critical scheduling
- EC: step discount partial migration + sampling broken in prod
- EC Oct 8: variant promos → 7–8 SKUs per bundle; admin delivery bands / rain / tips in-app
- CO Sep 13: flash promo slots beer midday / marketplace night; occasion cross-sell 2026
- CO Sep 13: SKU-level stockout in platform — rank #49

CX & communication

Sources: MX CX meeting · PE SL Sep 1 · Country visits · EC Oct 7–8 · CO Sep 13 · Puebla Project CX

- ~40% tickets are coordination — agents blind to courier map
- WhatsApp 100% default — no audit trail
- Ecosystem Communication umbrella — Brace + proof code + predefined messages
- Mandatory cancellation reasons lost in free-text
- Deposit-bottle disputes → 1-star when no seller channel
- Email support next day — too slow for peak
- EC: seller direct WhatsApp to consumer vs data-protection — CX-mediated flow preferred
- Puebla Project: parallel-email non-response, proactive WhatsApp limits (rank #39)

Expansion

Sources: EC Oct 7 product vision · EC Oct 8 workshop dreams · CO Sep 13

- Hybrid dark store + Community POC — 112 POPs / 41 cities
- Legal pilot before app-based POP pricing
- Seller acquisition landing (CO/MX) when Community POC GO
- Coast/insecurity zones where dark store cannot open
- EC Oct 8 dreams: international app listing for expats; multi-vertical festival basket
- CO Sep 13: ~double Community POC next year; own-store count may shrink strategically

Positive signals

Peru Web Tiendas (WebPO) — Local B2B portal: weekly KPIs, demand heatmap, VLC payments, productos de la semana. La Marina + Merino daily users. Template for what seller platform should become.

First-order badge — Actively used and valued across Puebla POCs — reduces coordination errors on new customers.

Brazil location UX — 50% faster address input, –1 pp location cancellations — config rollout candidate for Peru.

Club TaDa + returnable focus — Peru growth strategy aligns portfolio with retention — returnables retain 31.3% vs 20.7% Marketplace-only.

Courier Financial Report (Jumbo) — Product meeting: weekly courier payment summary launching on seller platform.

Delivery confirmation code — Ready globally — pilot per store in Peru. Reduces delivery disputes.

Notification center (Bolivia pilot) — Seller inbox for campaigns and ops comms — homologate to LATAM.

Ecuador stockout control (0.8%) — Centralized supply + DDC per POC + POC incentive <2% stockout — benchmark ops playbook while quantity UX catches up.

MotoGP courier gamification — Training points, SLA/rating gates, gift cards, rain/event bonuses — reactivation channel when forecast gaps appear.

CRM holdout incrementality — W40: +50% Fri / +40% Sun vs control; documents when pushes work vs when checkout breaks the promise.

Ecuador OYP workshop alignment — Oct 8 Lucid session validated near-term bets with votes — Club integration, POC tooling, profile/geo — and dreams (ERP, subscription, split pay) on one cross-pillar board.

Colombia availability score (BEES vs ERP) — Commercial ranking + variable pay when stores have stock but SKUs off in BEES — lifted onboarding/conversion; template for pre-integration markets.

Colombia partnership acquisition scale — 10–15% users at ~$2–3 CAC; proves bank channel — now must pair with retention design.

Field sessions

Jul 2026 · Mexico · CDMX store visits — 4 POCs — map, inventory, KPIs, WhatsApp

Jul 21 · Mexico · Promo workshop — Commercial — ideation, planning, upload/measurement

Jul 22 · Mexico · CX + Product meetings — Coordination tickets, inventory quantity, Jumbo report

Jul 23 · Mexico · OPS dynamics — Courier, Seller, Admin, CX, Consumer — 2027 vision

Jul 2026 · Mexico · Puebla store visits — 5 POCs — promo/supply, cold chain, spillover

Aug 31 · Peru · Context + store visits — Country briefing + La Marina, Merino, San Pedro

Aug 31 · Peru · Web Tiendas (WebPO) — Local B2B — weekly KPIs, heatmap, VLC payments

Sep 1 · Peru · Service Level vision — OPS + Product — ecosystem comms, inventory, Top Tiendas

Sep 2 · Peru · Workshop · Operations — OPS board — challenges, future, KPI visibility

Sep 2 · Peru · Workshop · Consumer — Consumer board — live map, data stack, payments

Sep 2 · Peru · Workshop · Rewards — Rewards board — Braze, wallet, anti-fraud

Sep 3 · Peru · Consumer vision — Product roadmap (multishowcases, Buy Again) + 18 Growth pains prioritized

Oct 7 · Ecuador · Product vision prep — Community POC hybrid, portfolio/stockout, MotoGP couriers, CRM/NPS — prep for Oct 8 OYP workshop

Oct 8 · Ecuador · OYP workshop (Lucid) — Single board Consumer + SL + Rewards — voting, dreams, hospitality; Club TaDa #1, POC stock, profile edit, BizWam cockpit

Sep 13 · Colombia · 1YP product intro — Growth/marketplace, BEES↔SIESA availability, own vs Community POC, stockout SKU ask, Club/For You, billing API — deeper sessions PM + Sep 14

2026 · Mexico · Puebla Project — CX rotation + Puebla/AGS stores — parallel email, Turbo/BEES, retention WhatsApp; cross-themes indexed in global ranks #39–40

Product outcome & roadmap

Outcome: Increase Perfect Order at peak by fixing reliability and inventory truth first — before scaling loyalty, vending, or football occasion bets.

North star: Fix what breaks at peak before adding new screens. Sellers will not adopt metrics or financial tools they cannot audit.

Layer 1 — Reliability — See and receive the order

Sound, session, push, map load. No Layer 3 without this.

Layer 2 — Peak decision — Distribute fast without leaving the screen

Assign on map, visual priority, multi-assign, fair SLA.

Layer 3 — Management & trust — Metrics, reimbursement, day planning

Date filters, line-by-line payments, admin cockpit — WebPO bar.

Now (0–3 months)

Stop losing orders at peak

Exit criteria: One POC runs a full Saturday without WhatsApp for dispatch; expired order rate down measurably week-over-week.

Order reliability — Stop silent misses and expired orders during peak shifts

Evidence: MX 6/9 POCs, PE 2/3 — expired when backgrounded

Operations map — Assign couriers without leaving the map; load 50+ orders

Evidence: Los Alpes; Forjadores blank at 20 orders

Live tracking — Real-time pin for seller, CX, and consumer

Evidence: ~80% of late complaints are display, not delivery

Inventory truth — Quantity in portfolio; combos and search that match reality

Evidence: Unanimous #1 CDMX; PE combo SKU still accepts orders

CX coordination — Structured cancellation reasons and pilot pre-defined messages

Evidence: ~40% tickets coordination; other field lost

Routing fairness — Limit spillover when neighbors disable SKUs; split dispatch SLA

Evidence: Merino +70 orders; Forjadores absorbs neighbors

Next (3–6 months)

Trust the platform

Exit criteria: Pilot POCs stop parallel Excel for KPIs and reimbursement; OPS reduces Sunday WhatsApp monitoring.

Actionable KPIs — Day, week, and hourly views sellers can manage daily

Evidence: 7-day rolling window blocks daily management everywhere

Financial transparency — Weekly reimbursement line-by-line — WebPO bar

Evidence: Bahia 30 min/week Excel; WebPO praised in PE

Unified peak surface — Map + kanban on one screen; multi-assign to riders en route

Evidence: Figma concept tested in every CDMX visit

Admin cockpit — Per-POC live KPIs for supervisors (Armis/Vitex bar)

Evidence: OPS workshop #1 vote both countries

Promo alignment — Seller sees promo 7+ days before consumer; supply slots aligned

Evidence: Stella in app but not BEES; Corona World Cup stockout

Later (6+ months)

Scale ecosystem bets

Exit criteria: Layer 1 stable in production; loyalty and consumer bets sequenced after data homologation.

In-app communication — Audit trail replaces WhatsApp for coordination

Evidence: Only after Layer 1 stable

Consumer self-service — Address modify and cancellation guardrails

Evidence: iFood/Uber benchmark

Courier economics — Peak incentives and daily earnings visibility

Evidence: Android stability prerequisite

Loyalty & growth stack — Braze, wallet, BEES admin, anti-fraud — after foundations

Evidence: PE workshop Sep 2 — data homologation first

2028 bets — Football occasion, vending, omnichannel — discovery only

Evidence: Sequence after Q1–Q2 foundations

Roadmap · Operations

Seller · Courier · Admin · peak dispatch

NOW

Peak reliability — Stop silent misses, session drops, and expired orders at Saturday peak · *IDs:* order-alert-session, courier-order-push

Operations map — Assign couriers without leaving the map; load 50+ concurrent orders · *IDs:* map-assign-stay, map-visual-priority

Inventory truth — Quantity in portfolio; combos and search match real stock · *IDs:* portfolio-quantity, portfolio-filters

Routing & spillover — Fair dispatch when neighbors disable SKUs; split prepared vs picked-up SLA · *IDs:* admin-polygon-neighbor, dispatch-sla-split

NEXT

Actionable KPIs — Day, week, and hourly views sellers and supervisors can act on daily · *IDs:* metrics-date-filter, metrics-hourly, metrics-ai-mvp

Admin cockpit — Per-POC live stock, SLA, availability — Armis/Vitex bar · *IDs:* admin-kpi-cockpit, admin-console-vitex

Unified peak surface — Map + kanban on one screen; multi-assign to riders en route · *IDs:* map-kanban-unified, multi-assign-seller

Financial transparency — Weekly reimbursement line-by-line — homologate WebPO pattern · *IDs:* reimbursement-breakdown, financial-report-date-filter

LATER

Courier economics — Peak incentives and daily earnings visibility on device · *IDs:* courier-financial-statement, courier-earnings-daily

Homologation checklist:

- Web Tiendas (WebPO) (Peru): Weekly KPIs, heatmap, VLC payments → seller platform
- First-order badge (Mexico): Keep and expand across POCs
- Brazil location UX (Peru): Config rollout — –1 pp location cancellations
- Notification center (Bolivia → LATAM): Seller inbox for ops comms
- Delivery confirmation code (Peru): Pilot per store — reduce disputes
- Courier Financial Report (Jumbo) (Mexico): Weekly payment summary on seller
- Ecuador stockout control (0.8%) (Ecuador): DDC per POC + supply playbook while quantity UX ships
- CRM holdout incrementality (W40) (Ecuador): Homologate push slots vs checkout coherence
- MotoGP courier gamification (Ecuador): Peak reactivation when forecast gaps

Open questions:

- Overlap test scale — Puebla ~3%: expand to more cities before polygon changes?
- Combo as third SKU — Victor Ágora ask in both countries: engineering estimate?
- Admin squad capacity — copilot vs manual console: what ships in H1?
- Colombia / Ecuador — when do visits start; same playbook?

Executive themes

Field & ops

Now: Peak reliability + inventory truth + fair dispatch

- Seller reliability at peak — sound, session, expired orders
- GPS / map frozen — ~80% of 'late' complaints are display
- Inventory without quantity — combos and search broken

Consumer

Now: Live courier map + wrong-address UX

- Courier pin stuck at store after leaving
- Wrong address — ~18% of cancellations (PE)
- Promo visible to consumer but not to seller/supply

Rewards

Now: Gate only — fix Layer 1 + data stack before scaling tiers

- CRM triggers need inventory + logistics truth first
- Club TaDa native integration — EC Oct 8 #1 vote + PE Braze enrichment
- Anti-fraud before scaling loyalty tiers

Consumer & Rewards topic snapshots

Consumer

Peru Sep 2–3 voted live map #1; Ecuador Oct 8 voted profile/geo + messaging and payment-off constraints — same trust handoff as MX/PE field visits.

Peru workshop · Sep 2

#1 · Real-time courier tracking on map — Consumer doesn't distinguish new vs retained — everyone expects live moto on map from pickup to delivery.

#2 · SDK + MMP integration & data homologation — Close AppsFlyer gap (70–80% of orders seen); enable attribution and paid media optimization.

#3 · Payment gateways (BIN / bank campaigns) — Mercado Pago-style partnerships — BBVA, BCP promos; unlock acquisition via card partnerships.

#4 · Coupon wallet UX & ordering — Visual redesign; monetary + non-monetary; Club TaDa integration without burying other coupons; manual sort today.

Ecuador OYP workshop · Oct 8 — Consumer votes

Critical · Online payments off — fraud trauma (board Critical) — Stored cards without step-up auth → cloning and chargebacks; COD blocks cancel fees and wallet dreams — rank #26.

2 votes · Remind user: not at delivery address — Reduce wrong-pin cancels — pairs with profile edit and map layers.

2 votes · Consumer ↔ courier message — Voted challenge — same class as rank #6 in-app comms.

2 votes · User can update profile anytime — First-order NPS — wrong phone/address without ticket path.

Ecuador OYP workshop · Oct 8 — Service level votes

2 votes · POC assign-order recommendations — Intelligent dispatch by order geography — ties to BizWam supervisor board.

2 votes · POC stock quantity per SKU — Vitex-style units with auto-off at zero — tied to rank #3 inventory MVP.

Rewards

Club TaDa is the hemispheric thread: Peru workshop stack + Ecuador Oct 8 #1 vote (4) for native integration. Gate tiers/omnichannel until Layer 1 reliability + sampling/catalog truth.

Peru workshop · Sep 2

#1 · Club TaDa × Braze — points for enrichment & channels — Sum points for surveys, data enrichment, channel opt-in — reduce monetary coupon dependency.

#2 · Flash coupon (burn) like flash promos — Time-boxed wallet coupons with countdown.

#3 · Rewards admin inside BEES admin — Unified platform for coupons, missions, rules — not separate download workflow.

#4 · Automated anti-fraud rules — Block bodegueros and abnormal point patterns via SessionM interface.

Ecuador OYP workshop · Oct 8 — Rewards votes

4 votes · Club TaDa integrated — External loyalty stack — workshop #1 near-term bet; blocks sampling/refund UX.

2 votes · Live visual for promo counters — Split campaigns (order #100) need in-app progress — rank #42.

2 votes · Auto-configured free gift products — Sampling loads fail to surface gift SKUs — rank #42.

Research lenses (global hub)

Thesis: TaDa does not primarily lose because of lack of desire; it loses when the promise breaks across inventory, seller, courier, address, ETA and recovery.

Reviews, churn, Lovers Plus, operations, sellers/couriers, visits, meetings, workshops and LATAM benchmark.

Limitation: Research evidence is deeper in Mexico; in Peru and Colombia, research and benchmark findings should guide hypotheses until locally validated.

- Fontes integradas: 10+
- Reviews Appbot: 1.630
- Churn survey: 379
- Sellers / couriers: 333 / 794
- Competitors: 3 × 3 países

The bottleneck is the handoff, not persuasion

Reviews point to delivery, accounts, payments and support; churn rises from 62% to 74% with 3+ frictions; sellers and couriers describe incomplete data, address problems, waiting and lack of support.

Implication: The same failure changes name by actor: stockout for the seller, route for the courier, delay for the consumer and ticket for CX.

Action: Measure one chain per order: availability → handoff → pickup → ETA → cancellation/refund → reorder.

Intent exists; inconsistency destroys habit

76% of churn survey respondents still saw TaDa as their first option; 76.6% of Lovers Plus would buy more if stock, hours and trust improved; 92% Perfect Orders in Lovers Plus.

Implication: Promotion can open the door, but predictability and recovery determine the second order.

Action: Make the second order and post-failure recovery the central outcomes by country, city and cluster.

Seller maturity needs its own play

Small in discovery: 85 sellers, 3.86/5 satisfaction and 2.9/8 metrics; Large anchor: 49 sellers and ~35% of estimated weekly sample value.

Implication: Volume is not maturity. The same dashboard and incentive do not serve small-seller activation and anchor-seller protection.

Action: Route by cluster: minimum operating routine for Small discovery; early warning, capacity and structured feedback for Large anchor.

Courier satisfaction does not eliminate friction

72% of couriers rate satisfaction 4–5, but 46.9% cite customer communication, 36.5% routes/address and 32.5% waiting.

Implication: A positive average can hide lost time and earnings during exceptions.

Action: Prioritize correct contact, realistic routes, time remaining, clear payment and in-flow support.

Service level is an end-to-end operating system

Lovers Plus delivers 48% SLA15 versus 35% Core; churn research links abandonment to stock, delivery and support; fieldwork and seller/courier research point to the same handoff failures.

Implication: A reliable service chain requires inventory truth, fair dispatch, stable maps, usable KPIs and structured exception handling.

Action: Gate every downstream initiative on availability, ETA accuracy, Perfect Service, recovery and homologated operational data.

Competition is about missions and trust, not copying a superapp

Rappi is the benchmark in all three countries; Uber adds mobility/retail in Mexico; PedidosYa competes on density, partners and fintech in Peru; Colombia is primarily an external benchmark.

Implication: The threat changes by country: breadth/ecosystem, speed, density, pickup, subscription and last mile.

Action: Compare the same mission (urgent, planned, group, pickup) by total price, ETA P50/P90, failure, recovery and frequency.

TaDa's advantage is focus; the risk is inconsistency

Competitors invest in Turbo, tracking, AI catalog, ads, loyalty, credit and integrations; TaDa has strong signals in beverages, Lovers Plus, WebPO and local solutions.

Implication: Breadth without reliability increases complexity; focus on occasion and service can differentiate if execution is measurable.

Action: Standardize what works (WebPO/KPIs, first-order badge, delivery proof, live map) instead of copying breadth without unit economics.

The same cockpit should support three decisions

OPS asks for predictive KPIs; sellers use Excel/spreadsheets; couriers lose time on routes/waiting; CX is blind on the map; competitors make tracking and support part of the promise.

Implication: Inventory, dispatch, customer communication and claims cannot live in stakeholder silos.

Action: Create a country/city/cluster cockpit with stock, courier coverage, handoff, ETA, cancellation, support, reorder and financial impact.

Decisions by horizon

Now · Confiabilidade do pedido — Perfect Service, fill rate, stockout, ETA P50/P90, handoff e cancelamento

Next · Habit and recovery — Second order, 7/30d repeat, post-failure recovery, SLA15/35 and realized value

Next · Ecosystem plays — Seller activation, courier retention, earnings/hour, ROAS, margin and coverage

Later · Breadth with control — Cross-use, frequency, omnichannel, fraud, homologated data and unit economics

Source groups

Consumer research — Appbot · churn survey · Lovers Plus. Polarization, friction, retained intent, service threshold and off-app behavior.

Execution research — Seller/Courier clustering · Annual Review. Maturity, handoff, capacity, markets and metrics operators can use.

Field and organization — Visits · meetings · workshops. Failures situated in city, peak, process, system and ownership.

Market — Competitors benchmark. Missions, ecosystems, speed, density, loyalty, fintech and country watchlist.

2. Stakeholder lenses

Consumer

Consumer needs, journey, trust, delivery promise, growth and retention.

Decision frame: Make the next order easier, more predictable and more valuable.

Rewards

Club TaDa, frequency, CRM, promotions, wallet, data and loyalty economics.

Decision frame: Build frequency on top of reliable service and clean customer data.

Service level

Operations, sellers, couriers, inventory, dispatch, CX and reliability.

Decision frame: Protect the handoff from stock truth to successful delivery and recovery.

All

The complete One Year Plan view across countries, functions and evidence.

Decision frame: Sequence the portfolio: reliability first, then growth and ecosystem bets.

Executive read · consumer

Consumer growth depends on a delivery promise that survives the journey.

Across countries, the consumer problem is not only acquisition. It is accurate address, available stock, realistic ETA, visible courier progress and fast recovery when something breaks.

The consumer lens prioritizes trust, the second order, repeat behavior and mission-based competitive comparison: urgent, planned, group and pickup.

Convergences for this lens:

- Consumer across countries: trust is won through accurate address, live ETA, clear delivery status and fast recovery.
- Wrong routing, stale maps and incomplete order information turn an operational defect into a consumer cancellation or support ticket.
- Lovers Plus and Buy Again show that convenience becomes habit when the next order is predictable and easy to repeat.
- Returnables, payment choice and the same mission benchmark define consumer value beyond a generic superapp feature list.

Executive read · rewards

Rewards should turn reliable service into frequency, not compensate for unreliable service.

Club TaDa, Braze, wallet, flash coupons and personalization are valuable only when events, inventory and delivery outcomes are trustworthy.

The Rewards lens prioritizes realized value, 7/30-day repeat, cross-use, promotion readiness and the economics of competing with Rappi Pro, PedidosYa Plus and Uber One.

Convergences for this lens:

- Rewards should amplify reliable behavior: Club TaDa, Braze, wallet and flash coupons need clean events and service truth.
- Promotion visibility must be synchronized with seller stock and supply, or acquisition creates a broken consumer promise.
- Frequency is the outcome: measure realized value, 7/30-day repeat and cross-use instead of coupon issuance alone.
- Competitive loyalty is ecosystem-based — Rappi Pro, PedidosYa Plus and Uber One — so TaDa needs a focused beverage occasion advantage.

Executive read · service-level

Service level is the operating system of the One Year Plan.

The seller → courier → customer handoff is the primary system to fix: inventory truth, preparation, assignment, route, ETA, support and recovery must be measured as one chain.

The Service Level lens prioritizes peak reliability, fair dispatch, seller/courier tooling, KPI visibility and repeatable plays by maturity and market.

Convergences for this lens:

- Service level across countries is a handoff system: inventory truth → seller preparation → courier assignment → delivery → recovery.
- Peak reliability, dispatch fairness, map stability and KPI visibility are the operating foundation for every other roadmap bet.
- Seller and courier research confirms that volume, satisfaction and maturity can coexist with severe exception friction.
- WebPO, live maps, delivery proof and predictive KPI cockpit are proven patterns to standardize across markets.

---

3. Mexico

Trip synthesis

20–28 Jul/2026 — CDMX: 4 stores (Bahia, Mixcoac, Los Alpes, Churubusco) · CX + Product + OPS meetings (Jul 22–23) · Puebla: 5 POCs (Jul 21 — Forjadores, Zavaleta, Jalpan, Talabera, San Jerónimo)

Across 9 visited POCs and 3 business meetings, the same structural gaps repeat: seller/courier tooling breaks at peak (map freeze, no order sound, expired orders), overlapping routes orders to the wrong store, and dispatch SLAs punish sellers who are ready but lack riders. CDMX KPIs flag Fill Rate pressure (Bahia –8 pp) and stockout risk (Mixcoac Others 17%). Puebla adds promo-vs-supply timing (World Cup 30→50% Corona with weekly delivery only), inter-POC volume spillover when neighbors turn off SKUs, and cold-chain limits at carton volume. Meetings reinforce: inventory quantity, in-app communication, daily KPIs, and fair peak distribution — now validated in two cities.

- Bahia: Fill Rate dropped 8 pp (Jun→Jul) — largest drop in the group; SLA 35 below 90%
- Mixcoac: stockout Others 17% — critical risk; Availability 89.1%
- Churubusco: lowest TML 10 in the group (38%); still uses Telegram to route orders
- Los Alpes: best overall performance, but forecast ignored and manual operations (Excel + notebook)
- Forjadores: 50 orders / 8 couriers on World Cup promo peak — map table froze; dispatch KPIs missed despite deliveries
- San Jerónimo: no order notification sound — expired orders; supply delivery Tuesdays only (4-day gap vs weekend promos)
- Zavaleta: seller app closes 4–5×/day silently; 10-min dispatch SLA red when order ready 3 min but courier waits 15 min
- Jalpan: nearby clients routed to other POCs — loses sales; newer store may get less algorithm priority
- Talabera: CX email tickets answered next day — wants faster channel like former WhatsApp
- Puebla-wide: Corona Mediana desabasto during promos; cold chain breaks on 10-carton orders (max 5 in fridge)

CDMX stores (KPI snapshot)

Bahia

Orders 5112 · Fill rate 90.85% · SLA35 85.81% · TML10 51.78% · Rating 4.91

Churubusco

Orders 5645 · Fill rate 94.04% · SLA35 92.44% · TML10 37.98% · Rating 4.88

The Alps

Orders 8526 · Fill rate 94.69% · SLA35 95.24% · TML10 67.79% · Rating 4.91

Mixcoac

Orders 9153 · Fill rate 92.26% · SLA35 88.71% · TML10 46.95% · Rating 4.83

CDMX cross-store patterns

[Critical] GPS and distributor tracking do not update in real time

Category: Bug · *Stores:* Bahia, Mixcoac, The Alps, Churubusco

The distributor's pin remains stationary in the store until the user leaves and returns to the screen. Consumer complains; seller loses visibility. When the delivery returns, the tracking disappears.

Why it matters: Appears in 4 stores (seller + courier). Impacts SLA 35, rating and complaints of 'I don't know where the order is'.

> Almost 80 of the clients tell us. (Bay)
>
> Many times our tracking does not appear... the customer sees that a little map appears where they see that we do leave the store. (Churubusco)
>
> Then if it takes time to update... they no longer open the map as such. (Los Alpes)

[Critical] Inventory without actual quantity — group priority #1

Category: Product · *Stores:* Bahia, Mixcoac, The Alps, Churubusco

SKU on/off does not reflect actual stock. Inflated numbers (thousands of fake pieces). No auto-decrement on TADA + floor sale. Manual review page by page.

Why it matters: Unanimous in all 4 stores. Los Alpes calls it 'top priority'. It affects fill rate, stockout and seller confidence in the system.

> Very, very much, it would be unified with the stores in the store. (The Alps)
>
> He's going to tell me that I have like three thousand or so pieces, when really it's not more. (The Alps)
>
> Inventory without categories; want quantity field with auto-decrement. (Bahia)

[Critical] In-app chat — today 100% WhatsApp and personal calls

Category: UX · *Stores:* Bahia, Mixcoac, The Alps, Churubusco

Seller, courier and customer talk to each other outside the platform. No history, no tracking, operational risk. They ask for chat in the context of the order (Rappi/Uber style).

Why it matters: 4/4 stores. Universal workaround. Resolves post-delivery contact, ordering instructions and coordination at peak.

> Since when I had already thought about it, that I could write to the client through the application. (Bay)
>
> In-app chat would reduce outreach — today 100% WhatsApp/calls. (Mixcoac)
>
> 90% I have to call them on the phone to let them know that I have arrived. (Bahia — courier)

[High] Overlapping sends orders to the wrong store or hides products

Category: Product · *Stores:* Bahia, Churubusco, Mixcoac

Nearby customer receives order from distant store. Products in stock do not appear in the app. Seller with 2 stores compares side by side to understand the routing.

Why it matters: Explicit pain in Bahia and Churubusco; Mixcoac cites unstable polygon. Generates cancellations, bad SLA and direct customer complaints.

> Hey, if you're here around the corner, why don't you bring me? They have to wait for me 35 minutes. (Churubusco)
>
> Overlapping sends the order to a distant store when there is a nearby store with stock. (Bahia)
>
> How are orders going to arrive on overlapiz and are rejections canceled if my clients don't see the products? (Churubusco)

[High] KPIs in a 7-day window — without daily team management

Category: UX · *Stores:* Bahia, Mixcoac, The Alps, Churubusco

Seller doesn't look at yesterday's performance to charge the team today. You lose history if you didn't write it down. Previous app allowed filter by day.

Why it matters: 4/4 stores ask for a daily filter. Performance dashboard is also not very intuitive (ranking, metrics).

> They can't see how day by day, how today they watered it. (Bay)
>
> I miss that part because this one goes away for the last 7 days and that's it. (The Alps)
>
> KPIs in 7 days; You want to filter by day like in the previous app. (Churubusco)

[High] Forecast of orders for the day does not match reality

Category: UX · *Stores:* Bahia, The Alps, Churubusco

Tela promises volume for the day (preparation time / expected orders), but sellers say it inflates or misses. Bahia documented it with captures: it scored 30, 7 arrived. Los Alpes ignores the number and chooses a team by eye (parties, quincena). Churubusco saw 15 expected vs 6 real — overlapping distorts even more.

Why it matters: 3/4 stores with explicit pain. Prevents staffing, preparation and trust in the dashboard. Mixcoac did not mention the prognosis directly.

> It marked 30 and 7 arrived, so it has never been exact. (Bay)
>
> I know that it doesn't give me a real number here, it doesn't work for me. (The Alps)
>
> Orders expected for today the 15th... yesterday we placed six orders. (Churubusco)

[High] Operations map: weak UX and assignment flow bugs

Category: UX · *Stores:* Bahia, The Alps, Churubusco, Mixcoac

Orders with no visible time (42 min = 35 min, both red). Assign distributor expelled from the map screen. Store pin disappeared. They request map + kanban on the same screen.

Why it matters: Map and the most used screen on the peak. Navigation bugs and lack of visual priority delay distribution.

> The ideal is that it doesn't take us out, that it stays here on this screen. (The Alps)
>
> The little store location no longer appears. (Churubusco)
>
> Then since everyone is red... some differentiation to know which ones are left. (Bay)

[High] Distribution of orders to the courier fails at peak

Category: Bug · *Stores:* Bahia, Mixcoac, Churubusco

Order does not arrive in the app without manual refresh or ticket code. App crashes and needs to be reinstalled. Saturdays are critical.

Why it matters: Direct bottleneck at TML 10 and SLA 35 on weekends. Churubusco still uses Telegram for routing.

> At first when I changed this application a lot, they didn't reach you. (Bay)
>
> Saturdays: order does not arrive on the courier app without refresh or manual code. (Mixcoac)
>
> Telegram still used to distribute orders and routes. (Churubusco)

[Medium] Inventory without filters, categories or useful search

Category: UX · *Stores:* Bahia, Mixcoac, The Alps, Churubusco

Huge list in no logical order. Search requires exact name. They want to filter by availability, brand and best-selling products.

Why it matters: It complements the quantity problem. Los Alpes manually reviews 183+ SKUs; pagination repeats items.

> When we advance the page it does not advance us 10 at a time... they keep repeating themselves. (The Alps)
>
> Inventory without categories; search requires perfect name. (Mixcoac)

[Medium] Reports and reconciliation still manual (Excel, notebook)

Category: Operation · *Stores:* Bahia, The Alps, Churubusco

Payments to couriers, sales by product for taxes and refunds are output in parallel spreadsheets. Date filter in the financial report with a bug.

Why it matters: Signal that the platform does not match the operational cycle. Los Alpes uses notebook + daily Excel.

> Strong manual operations (payment Excel, WhatsApp). (Bahia)
>
> Operates with strong manual control (libreta, Excel, WhatsApp). (Los Alpes)

[Medium] Beer at room temperature and warm product — lost sales and rating

Category: Product · *Stores:* The Alps, Mixcoac, Bahia

Only cold beer on the app when they also sell it at room temperature. Without ice/space, product arrives hot and generates complaints.

Why it matters: Local mix/catalog theme. Los Alpes loses sales on party days; Mixcoac and Bahia cite temperature complaints.

> It seems silly to me not to have it because you lose a lot. (The Alps)
>
> Complaints: late delivery and hot product (no space for ice). (Mixcoac)

CDMX store interviews

Bahia

Small store (~300 orders/week, peak Fri-Sat), 8 trusted distributors. Strong manual operation (Excel payments, WhatsApp). Confusing KPIs; real focus on stock and preparation time.

Bug · Distributor GPS does not update in real time

Both on the seller's map and on the consumer's app, the distributor's pin only moves if the user leaves the screen and returns. It stays in the store even after leaving. When the distributor returns, the tracking disappears.

Source: Seller + Courier

Quotes:

> That doesn't happen here, the dealer is still there, that is, if you don't step back, come back, you won't see the dealer's beeper moving.
>
> The game leaves and if it leaves and you can see how it moves, but when you return you can't see it anymore. On our way back we never noticed it.
>
> Almost 80 of the clients tell us.

Bug · Request accepted does not change status

Some orders accepted by the distributor do not update their status on the platform. Cases are counted, but recurring since changing apps.

Source: Seller

Quotes:

> Those who do not change their status are few. They do not change status, but from here to here the splitter proceeds.

Bug · Slow distribution under high demand

In case of saturation, the order does not arrive on the courier app without a manual refresh or ticket code. The process becomes a bottleneck on weekends.

Source: Seller

Quotes:

> At the beginning when this application changed a lot, if they didn't arrive or then sometimes when they closed the order they didn't take some.

UX · 7-day KPIs — no daily view

Seller is unable to see the previous day's performance to manage the team in the afternoon/evening. Before, I cut daily; today it depends on a supervisor or external Excel.

Source: Seller

Quotes:

> I just don't understand, but this information is for 7 days, that is, those who already understand it know that it is for 7 days.
>
> They can't see how day to day, how they watered it today, especially when they also have a person, they don't have a person here, they can come in in the afternoon and they can say oh tomorrow they delivered so many late, they canceled so many.

UX · Performance dashboard not very intuitive

Ranking, fulfillment and metrics are not clear. Team focuses on stock, preparation time and delivery time — does not understand what impacts the score.

Source: Seller

Quotes:

> Sometimes it has been difficult for us to understand that. In fact, one day with the girl I have here, in a way we were deciphering it as knowing what it could be.
>
> It's the owner's doubt. It also happens to us with other stores.

UX · Daily order forecast is not reliable

Preparation time screen promises volume for the day (e.g. 41 orders), but rarely matches. Seller took captures for 1.5 weeks: system scored 30 and 7 arrived. Weekend comes closer; weak days make a lot of mistakes.

Source: Seller

Quotes:

> Today I expect that there will be 41 orders to prepare, I have a thousand screenshots every day since this new one, this new program started, I took about a week and a half captures of every day, I marked 30 and 7 arrived, I mean it has never been as exact, there are times when it has happened, the truth is I don't lie, but rarely does it get it right.
>
> Yes, it is closer to the number it says than today, Monday or Tuesday or Wednesday. For us, Thursdays, Fridays and Saturdays are the busiest.

UX · Map: distinguish en route vs pending orders

With 5+ requests in the same zone, they all turn red. Before, there was a little house icon for en route. They ask for different colors by status and by distributor.

Source: Seller

Quotes:

> Maybe paint a different color to know why sometimes it happens to us that in that area we have five orders and it's already going there but two fall again.
>
> Then since everyone is red, I tell you that it is like a little helmet or a house, some differentiation to know which ones are left.

UX · In-app chat seller-courier and seller-client

Today everything via personal WhatsApp. They want Rappi/Uber type communication within the platform, including after completing the order to resolve pending issues.

Source: Seller + Courier

Quotes:

> It would be great if an indication could be sent to you through the application.
>
> Since when I had already thought about it, that we could write to the customer through the application and we could have a chat with the delivery person.
>
> I like them like Rapi's, literally.

UX · Customer information disappears after order completion

If the distributor finishes early and forgets the gift or needs to contact the customer, he no longer sees the phone number/address. You have to reopen the order manually.

Source: Seller

Quotes:

> Once the order is finalized, you can no longer see the customer's information.
>
> They can't see the phone anymore. It wouldn't end.

UX · Arrival notification does not reach the consumer

The 'ya llegue' button is an illusion — the consumer does not receive an alert. 80-90% of couriers need to call; customers do not answer unknown numbers.

Source: Courier

Quotes:

> The user notification is very subtle.
>
> 90% I have to call them on the phone to let them know that I have already arrived at their home.
>
> Today, 80% of users have their call forwarding or caller ID activated.

UX · Inventory without category/brand filters

Huge list in alphabetical order. Seller goes item by item. Do you want to segment: beer, soft drinks, wine, snacks. Search only works with exact name.

Source: Seller

Quotes:

> Separating them by segment would help us a lot to perhaps do the inventory faster because then check them one by one, well as I told you, very long.
>
> There are times when what I do do is even one by one I see, one by one I see.

UX · Assign multiple orders at once

Today it accepts one, assigns it, accepts another. You want to select 2-3 nearby orders and send them to the same distributor at once.

Source: Seller

Quotes:

> I would like this. Two orders for mine, three orders like this, accept all, but to prepare I'm going to select two.

UX · Reorder delivery sequence (courier)

Previously, the distributor sorted the orders before processing and the order was maintained. Today the system reorders by time and shifts the planned route.

Source: Courier

Quotes:

> Previously the delivery man could order his orders and today you can't do that anymore, you can't do that.
>
> First, second, third procedural and do not put them out of phase, the third comes first.

Product · Overlapping prioritizes product, not distance

Main complaint: order goes to a distant store when there is a store next door with stock. Customers cancel and reorder until they find the right store. Affects SLA and satisfaction.

Source: Courier

Quotes:

> Why are they sending me a faraway store? I'm walking and I see that they have it and I know that it is such a store and they are sending me.
>
> Many people complain about that, they come to the stores because they obviously already know that this is a point where they tell us, hey, how is it possible that you have a product and you can't send me here to the paintings.
>
> Prioritize delivery, time, distance, then the product.

Product · Unstable polygon (large/small)

Frequent changes in the polygon take or give orders without warning. Zones they had before have been removed; sellers lose volume and distributors are idle.

Source: Seller

Quotes:

> It changes a lot, It changes a lot. Today we're not going there and tomorrow we are, but it's not good.
>
> Then we get used to the orders that may come out there and they take orders away from us, they have taken them away from us and it will be very clear.

Product · Quantity field in inventory

You want to mark real items (e.g. 40 Corona) and the system will automatically discount it. Avoid ordering when there are 2 units left. Prefer manual control to auto-delete SKU.

Source: Seller

Quotes:

> By having that, when placing the order it is discounted and that would help us so that they do not send us extra orders.
>
> I would prefer to delete, right? Yes, because then there are times when they don't pay attention, we get products that we don't have.

Product · Weather button for dynamic shipping rate

In rain/hail shipping costs don't go up (Uber/Didi double). Couriers lose revenue. They suggest a button with evidence to activate regional surcharge.

Source: Courier

Quotes:

> It would be good if they implemented a button on the base application platform where they could activate that button as a way to report that an explosion occurred in their area and send evidence.
>
> Uber and Didi are doubling their shipping costs. I feel like a lot of input is being lost there.

Product · Minimum penalty for consumer (does not decrease)

Customer may take 10+ minutes without getting off; courier wastes time and does not receive cancelled. They suggest a symbolic fine (~10 MXN) like Uber.

Source: Courier

Quotes:

> A minimum penalty of at least 10 pesos would be good.
>
> It's been 10 minutes and the client still hasn't come down. And that affects us.

Product · Tenant flag (events) vs residents

Renters ask for high volumes (12 megs cold), complain and report badly. App and focused on residents; sellers want to signal their profile to support.

Source: Courier

Quotes:

> The tenants are taking advantage, why? For the same cost of the product it is much lower.
>
> Those places are usually the ones that criticize the delivery people badly and are complaining.

Operation · Manual financial reconciliation (30 min/week)

Seller trusts Ricardo's Excel, does not use the app's financial report. Compare coupons, commercial difference and last mile manually every Monday.

Source: Seller

Quotes:

> How much time do you spend? Half an hour. It's just that I already do it very quickly.
>
> He always guides me through their archive. But look what it was before payment for Ricardo.

Operation · Secondary warehouse 3 blocks away

Small space in the store; replenishment via WhatsApp with a neighboring bodega. Avoids canceling orders but generates two stocks and inventory confusion.

Source: Seller

Quotes:

> It's literally six, five blocks away. You take the product.
>
> I use it there as a warehouse. Then you know that because of space I no longer have a regular tin. Oh, send him here and I'll take you.

Operation · Rain protocol

With hail they close; in heavy rain they pause the store when they accumulate 5-6 late orders. Local decision, without tools on the platform.

Source: Seller

Quotes:

> When you already have a saturation of a quantity of orders of five or six orders that you already see that they can no longer be delivered and that they are delayed, that is when you do the most important thing.
>
> There is hail, that is, if there is hail, then it cannot rain, they do not escape strongly if it comes out.

Operation · Suporte via e-mail lento

For complaints, they prefer to call the customer directly instead of opening a CI ticket. Email chain is slower than direct resolution.

Source: Seller

Quotes:

> I better call him, I look for the data and I call him faster, because I miss that communication in what the IC says.
>
> There he sends me the email, I reply to the email, he does the rest for me and it takes longer, I think.

Infra · Limited physical space restricts stock and ice

Very small store; There is nowhere to store ice. Impacts quality (hot product) and available mix.

Source: Seller

Quotes:

> Here our space is very small.
>
> We arrive and open, then we start giving, and since the delivery person lives very close, when the order arrives we notify him of the order and it arrives soon afterwards.

Infra · Poor quality delivery bags

Plastic brooches break in 3-4 months; fabric wears out with rain and weight (10+ kg). Previous versions were better. Metallic brooches are suggested.

Source: Courier

Quotes:

> The clasps must be metal and must not be plastic because compared to other applications it is not the same.
>
> This, this breaks. We've been here for a month, two months.
>
> When they are agglomerated we easily carry more than 5 kilos.

Infra · New computer due to poor audio on previous one

They changed PC because order alerts didn't sound. Operation depends on listening to notification in tight space.

Source: Seller

Quotes:

> We just bought this computer because the other one we had could hardly be heard, I don't know why it always sounds here.

Mixcoac

Largest volume of the group. Newest team on the platform. Code on delivery helped fulfillment. Same GPS/map bugs. Inventory and Saturday saturation are main pains.

Bug · GPS does not show distributor moving

On the map, the distributor appears standing in the store even after leaving. You need to go back to the previous screen and re-enter. Same bug in the consumer app.

Source: Seller

Quotes:

> You can't see when it's going, you have to pull it back.
>
> They don't visualize that, you don't see how it's going, you don't see it.
>
> The same thing happens with the consumer app. If you cannot, the consumer has to leave and return so you can see that it is updated.

Bug · Saturday saturation: order does not reach the courier

In high demand, the order remains pending on the distributor's app. Current solution: repeated refresh or manual ticket code. Sometimes the code also fails.

Source: Seller

Quotes:

> On Saturdays with high demand that they can't get, the order doesn't arrive and they have to enter it manually, they have to give it the manual code so it can.
>
> The communication between SEL and the courier does not reach communication.

Bug · Courier app needs constant refresh

Distributor needs to update app to receive orders. It remains 'pending' even after assignment by the seller.

Source: Seller

Quotes:

> It has to give refresh, refresh or in this one it has to give us like to give between fresh so that it can receive because it just says pending, pending.
>
> They want to assign the delivery girl just like they did, it doesn't arrive, it doesn't arrive.

UX · Seller-client and courier-client chat

Main request of the visit. It would reduce contact and speed up delivery. Today, personal WhatsApp or phone calls — customers do not answer unknown numbers.

Source: Seller + Courier

Quotes:

> The chat is going to help us a lot.
>
> When we have the chat it will help us a lot to reduce contact, to have a more effective delivery.
>
> I think that both things would be good, WhatsApp is the personal one, the chat if we take it here from the application.

UX · Arrival notification does not alert consumer

Courier presses 'llegue' but consumer sees 'aun va a salir'. You need to call or go to WhatsApp. Push exists but it is too subtle.

Source: Courier

Quotes:

> It's an illusion for him, he doesn't know. Yes, because many times when you are already there it says well the application appears to me.
>
> When I say I've arrived, it only shows I've arrived. I don't know if he gets an alert when I've arrived. I don't think it appears.

UX · Connection without app identification

Generic or personal number of the courier. Customer does not respond. Uber shows that and from the platform — they ask for the same.

Source: Courier

Quotes:

> Many times it is because I do not answer unknown numbers.
>
> At Uber they know the number because it is already registered, that would help a lot.

UX · Select multiple orders for a distributor

Today: accept, attribute, accept again. They want to book 2 orders together and send them together. Peak time savings.

Source: Seller

Quotes:

> Instead of entering one by one, you could select as many as two and send those two to them.
>
> I have to accept it again and send it again and he has to accept it again. It would be faster, above all.

UX · Inventory without categorization

List mixes beer, ice, snacks in no order. To find a product you need to know the exact name. They ask for filter by category or brand.

Source: Seller

Quotes:

> When they want or we want to show them, especially when we are training, this is a list of as many pops as possible.
>
> If they write something wrong, it doesn't matter, it doesn't appear.
>
> We put soft drinks or chetos or everything else to see as above.

UX · Portfolio minimo vs catalogo completo

Two confusing screens: 'minimum portfolio inventory' shows few items; full catalog has 50+ pages. Makes training and search difficult.

Source: Seller

Quotes:

> Here in minimum portfolio inventory, only certain products appear. And in another catalog there is already the entire list where everything is complete.
>
> They have to put in about 50 pages so they can manually view and move the rest and then they have to go back.

UX · KPIs: understand metrics and act

In the KPIs session (Mixcoac 3): they understood preparation time (target 5-6 min) and cancellation due to delay. Hot product and main rating complaint.

Source: Seller

Quotes:

> This ultimately has to be about five, six minutes maximum.
>
> Most complaints are because we are delivering late, because the product is hot, so we always refill very quickly.

Product · Code on delivery worked

Since May, it has reduced 'never delivered to me' complaints by 0.5pp in fulfillment. Eliminates the practice of closing an order without delivering it.

Source: Seller

Quotes:

> We implemented the cash on delivery code, it helped us a lot starting in May because we had complaints from consumers who said they never delivered to me, today we dropped 0.5% in fulfillment.

Product · Push 'estate atento' ajudou

Notification to the consumer when the distributor arrives has improved deliveries. But without penalty, the customer still takes a while to get off.

Source: Seller

Quotes:

> The push to the consumer to pay attention, your delivery person has arrived, that has helped to make a more scientific delivery.
>
> It gives you visibility, you have a good track and it also vibrates you.

Product · Payment for cancelled orders (Monterrey)

In some cities they already pay the courier for cancellations. Not yet here — courier wastes time/gasoline when customer doesn't show up.

Source: Seller

Quotes:

> Starting in the city of Monterrey itself, we are already paying for the canceled ones, but before we didn't pay for the canceled ones.
>
> Finally you already went, you return and you had no benefit.

Product · Cleanup of inactive SKUs

Many SKUs that do not sell remain in the catalog. It makes it difficult to turn products on/off and generates orders for unavailable items.

Source: Seller

Quotes:

> You have many SKUs, they don't even sell. You have to do a cleaning.
>
> Tombs come out that only leave for two weeks and stay there forever.

Operation · Cancellations: customer does not answer or card fails

Main reasons on Saturday: customer doesn't come down, doesn't answer, or doesn't pass their card through the clip. Customer demands to close order only after payment.

Source: Seller

Quotes:

> Well, because there are clients who do not answer or who do not pass the card.
>
> You don't want to give them the code until it closes, so you have to cancel.

Operation · Distributors do not always carry a terminal

Order says cash but customer wants card. Courier without clip generates waiting and delays. Saturday peak amplifies the problem.

Source: Seller

Quotes:

> Even though it says cash, they don't always take it and then they have problems and that's when it's the most obvious, it's not that they don't give me the card.
>
> First, until they pass the card, they don't read it, I clip it, they don't want to close it.

Operation · Seller calls customer on behalf of courier

When the courier cannot contact you, the seller intervenes. Increases operational load during peak hours.

Source: Seller

Quotes:

> They tell me or then they send me a message, they don't answer me and I already dial them, I'll do them the favor of dialing them.
>
> When no one answers either by WhatsApp or by call, then it's time to cancel.

Infra · No space for ice

They don't buy ice because there's nowhere to store it. Hot product complaints impact rating. Goal: refill water quickly.

Source: Seller

Quotes:

> Right now we don't have it because we don't have anywhere to put them, we don't have a way.
>
> Most complaints are because we are delivering late, because the product is hot.

Infra · Small display, separate warehouse

TaDa CDMX store standard: small storefront + auxiliary bodega. Makes unified inventory control difficult.

Source: Seller

Quotes:

> What he says is that this is like the ones on display and there is his warehouse.
>
> I use it there as a warehouse. What I'm getting at is that I can't keep much beer here.

The Alps

Mature store (~380 orders/week, 50% TADA + 50% floor). Operates with strong manual control (libreta, Excel, WhatsApp). Best KPIs of the group, but outdated inventory and limited reports.

Bug · Inventory pagination repeats products

When advancing pages, do not advance every 10; repeat items. Team reviews 183+ SKUs page by page manually.

Source: Seller

Quotes:

> When we advance the page it does not advance us 10 at a time, so that is why it is 180, because we are really moving forward. I think it's like 6 in 6 more or less and even if I put it 50, even if I put it 50, it keeps repeating itself.

Bug · Assign order kicks out of map screen

When assigning a distributor, the system redirects to current orders. Seller wants to stay on the map to assign several and check products.

Source: Seller

Quotes:

> When I assign an order from here it also takes me out and takes me to this one, to current orders, if I here before printing it appears that I choose to deliver, the delivery son and takes me out.
>
> The ideal is that it doesn't take us out, that it stays here on this screen.

Bug · Distributor's GPS takes time to update

Tracking works sometimes, but it takes time. Experienced staff do not monitor as much as they know the area.

Source: Seller

Quotes:

> Then if it takes a while to update or I think it affects them then they already know what the location is, there are already a lot of customers who are already frequent, so what they do is they no longer open the map as such.

UX · KPIs in 7 days — want daily filter

Before, you could see performance from previous days to manage the team. Today you lose last week's history if you didn't write it down.

Source: Seller

Quotes:

> I miss that part because this is the last 7 days and that's it, so for example, I already changed Tuesday, Wednesday and I no longer know what my average was for the previous week. If I didn't check it, I didn't even know where I was.
>
> To show the kids no, no, no, again you affected me because you didn't come and look that week look how we went out.

UX · Order forecasting is not real – team scale in the eye

Seller ignores the platform number and creates his own forecast (parties, quincena, local teams). App does not help you decide how many distributors to place on shift.

Source: Seller

Quotes:

> We already have a forecast that I calculate is more realistic, that is, I know when there is a game, I know when there is a fortnight and I know that it doesn't give me a real number here, it doesn't work for me.
>
> Depending on your position, you have the possibility of receiving more orders, so it also helps me to know how many delivery people work or how to improve that number.

UX · Inventory: available filter + popularity

You first want to see products turned on/off and those that sell the most, like in the Modelo app. Current list mixes everything up.

Source: Seller

Quotes:

> In this case it is convenient for us that it be like this, that is, that those that are available to order appear first, so that those that are not available are of no use to us.
>
> A double filter that shows us products that are not on because this way we can review them faster.

UX · Map with time visible in orders

Color bar does not distinguish priority (42 min vs 35 min both red). Want to see minutes or map+orders together.

Source: Seller

Quotes:

> I have one of 42 minutes, for example, I have one of 42 minutes and a 35 minute one appears in red, so I no longer know which one really has priority.
>
> If I had a little circle here and said 15 minutes like that, it would help us a lot.

UX · WhatsApp to save order data

Instructions disappear after completing the order. Copy request to WhatsApp to maintain contact and conference with floor.

Source: Seller

Quotes:

> When you have already closed the order, the instructions do not appear in the order list, so that is why we have it or we can no longer have contact. This way we keep the contact, if there is any problem with the order, we already have it more at hand.

UX · In-app chat

Same need as other stores — replacing personal WhatsApp for customers and distributors.

Source: Seller

Quotes:

> Since when I had already thought about it, that we could write to the customer through the application and we could have a chat with the delivery person.

Product · Quantity field in inventory

Inventory shows 4M fake parts. Sells TADA + flooring but does not discount. Need for taxes and royal control.

Source: Seller

Quotes:

> Very, very much, it would be unified with the stores in the store.
>
> He's going to tell me that I have like three thousand or so pieces, when really it's not more.
>
> The correct thing for me would be a link, if that is not possible, at least have a report, that is, a daily sales report appears.

Product · Beer at room temperature (not just cold)

They lose sales and rating when they end up cold but at room temperature. I criticize on party days.

Source: Seller

Quotes:

> It seems stupid to me, I'm even going to say it as it is, the rudeness, stupid. It seems stupid to me not to have it because if you lose a lot.
>
> We only have the time you would have had it on, we don't have it because we have it, because most people complain that I didn't send it cold.

Product · Promotion push before matches

Saturation in games (orders of 5 in 5). Want to notify the consumer to order 2-4 hours in advance and distribute demand.

Source: Seller

Quotes:

> The game starts at 7. Take advantage of your promotions... you have up to two hours before to order and have the promotion.
>
> Then it is impossible, that is, really before the game, not during it, it would even be better, that is, even for profits, because at game time everyone will ask you.

Product · Sales report by product (not Top 10)

You need to know how many pieces of each SKU you sold to invoice taxes (VAT vs IEPS). Top 10 won't do.

Source: Seller

Quotes:

> A top ten doesn't help me, it would help me how much of each product was sold, how much I sold yesterday.
>
> In order to invoice, I need to know how much product was produced, because for example, beer has VAT, but snacks have IEPS, which are two different taxes.

Product · Products sold in other stores in the area

Want to benchmark disconnected SKUs that sell in neighbors — mix opportunity (e.g. Topo Chico, New Mix).

Source: Seller

Quotes:

> What products are other branches selling that I don't have on as an opportunity.
>
> We just added the Topo Chico pigeon that we didn't have because clients started asking me.

Operation · Manual payment tracking (notebook)

Weekends with 6-7 people on the floor. They charge order by order in a notebook, they do not use the app's financial report.

Source: Seller

Quotes:

> We carry out a manual control, let's say, instead of keeping the control that you charge at the end, we charge them every time you return.
>
> We write down the quantity 284. And the number of containers.

Operation · Financial reconciliation by trust

Trust payment without auditing order by order. Want to degloss in financial for random spot-check.

Source: Seller

Quotes:

> I trust them. It's not that it's true, I told Luis since I came in, I told him I don't see, that is, how am I going to check.
>
> Order by order, Yes, because for example, there I can check if the order number appears.

Operation · Refund without customer phone in email

When CI sends a refund without a number, it searches WhatsApp for codes. Fragile manual process.

Source: Seller

Quotes:

> The client's telephone number does not appear here, it is not the first time that it has happened to me that the client's telephone number does not appear.
>
> I looked for it on WhatsApp where we keep the codes like this.

Infra · Hidden store / poor visibility

New customers don't find the store. Trees block facade.

Source: Seller

Quotes:

> We are half hidden. Yes, I didn't see it here. He followed me, I turned him around, I never saw him.
>
> Clients came and told us they are new. Not us, we already have a year. I just hadn't seen them.

Infra · Physical space and refrigeration

50% floor sales + TADA. They use extra fridges on weekends. No stored ice.

Source: Seller

Quotes:

> Andamos como 50 y 50. 50% tada, 50% venta, entonces llega a ser muy fuerte.
>
> We have coca in the refrigerators in Penafiel, we have beer there because there is a lot of demand, we even have that other refrigerator that we use on weekends.

Churubusco

Seller manages 2 stores (Churubusco + Caporal). ~250-300 orders/week. Overlapping is the biggest pain. Still uses Telegram to route orders. Courier Lenin and reference (110 orders/day).

Bug · Consumer does not see products (overlap/stock)

Customer reported that he did not see Victoria despite the store having stock on. Affects requests and rejections.

Source: Seller

Quotes:

> A client reported to me that no products appeared. I told him, hey, how come he doesn't show up? You have no victory. Tell me, of course, if I have it.
>
> How are orders going to arrive on overlapiz and are rejections canceled if my clients don't see the products?

Bug · Store pin disappeared from the map

Before, the store's little house appeared on the map; not now. It makes routing and understanding overlapping difficult.

Source: Seller

Quotes:

> The location of the store no longer appears. Be careful there. It doesn't seem like it. It doesn't seem like it. That's from my observations of no store.
>
> Yesterday I took them out because the store pin is not showing up.

Bug · Courier app freezes — needs reinstall

Some distributors lose orders when the app freezes. It happens more in saturation.

Source: Seller

Quotes:

> She is shocked and they have to uninstall and reinstall and then she grabs your orders with a good one and has to uninstall.
>
> That order was already burned and I had already had two and both orders were already burned.

Bug · Date filter in financial report

Request for the 18th only appears if you filter 18-19, not on the 18th alone. Breaks conference with distributor.

Source: Seller

Quotes:

> It should be that it appears here on the 18th, It should be that it appear here, do you agree? In the last order and it does not appear.
>
> If you look for it, the mere 18 does not appear, that is, if you look for it, the mere 18 does not appear.

UX · KPIs with filter by day (not just 7 days)

Want to see how it turned out yesterday to give feedback to the team. Same pain as Bahia/Los Alpes.

Source: Seller

Quotes:

> It would be great if you could filter for a day, two days to check that.
>
> Oh look guys, yesterday Lenin you burned three orders or we'll go out to 90.

UX · Order forecast does not match the operation

Seller with 2 stores compares forecast with real volume. I expected 15 orders on the day; the day before they did 6. I suspect the number because of overlapping — orders go to the other store.

Source: Seller

Quotes:

> This forecast for today works as it is today, orders expected for today the 15th is the same, so it coincides. For example, yesterday we placed six orders.
>
> What I told you at the beginning, that the information is true, because then it doesn't match what they send me.
>
> It depends a lot what I want to have is the overlap, because I give myself a lot, I am very emphatic with that because I realize it, because I have the other store.

UX · Map + orders on the same screen

Seller routes via the map but needs to copy orders to Telegram. You want to assign without leaving the map.

Source: Seller

Quotes:

> Bring everyone closer, how do you do it? When several arrive, I accept all and I see the map to see where they are going and how to route.
>
> It would be good. And where is it? That's just another observation I had.

UX · Telegram still used for orders

Distributors used to Telegram for codes and routes. App does not completely replace it.

Source: Seller

Quotes:

> I copy what I do and send it to you via Telegram, because that's how we get used to it, before we didn't have that option to send it there.
>
> I know how I send them to them and I continue to send them to them by telegram, the order.

UX · Multi-select orders with route order

You want to send 2-3 orders at once, but the seller still needs to advise which one goes first.

Source: Seller

Quotes:

> Select the orders, be able to directly send two, three, but with a single movement.
>
> Then you have to tell him which one goes first or how the route looks.

UX · Export financial report to Excel

Today you copy and paste manually. Want to download to control payments to distributors.

Source: Seller

Quotes:

> What would also be cool would be if we could download it in some format in Excel.
>
> What I have to do right now is that I go, I check it and I copy and paste it.

UX · In-app chat (seller + courier)

Lenin confirms that chat would help, especially with outdated numbers.

Source: Courier

Quotes:

> Yes, it would help us, but there are also times when, for example, the client has the application but their number is no longer the same.

Product · Overlapping uses a 3-hour window

Seller thought it was 1am. Algorithm penalizes stores that delivered 3 hours late, even with stock and distributors.

Source: Seller

Quotes:

> I knew it was an hour, so well, it's three hours, so what we've got back is from three hours ago.
>
> Leveling those three hours is a lot of time to play with.

Product · Reassign order after courier starts

When the order arrives, send the courier to load it and insert it. Prefer to reassign as in Tucan.

Source: Seller

Quotes:

> I send the order and say enter it there. Because that's what I told Javi that they were going to see that option that we could reassign the order after they left.
>
> I'd rather be hit on this, in Akurashi than hit on this, on delivery time.

Product · Quantity field in inventory

Before they had piezas; today they delete the entire SKU. Want fine control for low rotation products.

Source: Seller

Quotes:

> Before we could put the pieces in, now that it's happening, maybe I'll have a brass ultra tray left, I won't pay for it. But do you think it turns out that the customer asked you for 25 cans.
>
> It would be good to put exactly the amount as we used to before.

Product · Consumer blocked while gaming

Customers were unable to order in the World Cup semi-final. Some created a new account and lost points.

Source: Seller

Quotes:

> He didn't let them be requested during World Cup matches, telling them that he had no data, that they had no signal.
>
> What others did was cancel, they registered another account because they couldn't.

Product · Confirm payment method after delivery

Customer changes card for non-local cash. Courier does not remember; wrong terminal.

Source: Seller

Quotes:

> The customer put a card, he gets there and it appears past me because I went to deliver, they put a card and you don't have change because it's a card.
>
> Al final del dia del cuadraje, oye, me falta efectivo, me sobra efectivo ese cambio.

Operation · Manage 2 stores manually

Redirects orders and distributors between Churubusco and Caporal to avoid SLA failure.

Source: Seller

Quotes:

> I from Churubusco to here make the orders that they receive here, because they receive orders here, here, here, Caporales here.
>
> If I am saturated in a store, I send a delivery person there. Here you have the other store.

Operation · Modelorama promotional price difference

Buy high, promotion pays low. Hard to audit if margin is recovered.

Source: Seller

Quotes:

> Last month I grabbed and jammed the warehouse with an expensive price and in the middle of the month they launched the lowest promotion.
>
> I buy expensive. They tell me, hey, we are paying with the new price. Then he tells me, no, yes, but in the end you stay.

Operation · Cancellations due to outdated phone

6-7 cancellations/week due to not being able to contact. Wrong numbers in the base.

Source: Seller + Courier

Quotes:

> If we get to have an easy one, about six, seven a week that I can't communicate with.
>
> The client has the application but his number is no longer the same, the number already changes but not only by updating the application.

Infra · Consumer GPS does not update (courier)

Customers see a distributor standing in the store. They need to exit and return to the app.

Source: Courier

Quotes:

> Many times our tracking does not appear, that is, the customer also sees that a little map appears where he sees that if we leave the store, he says that many times it does not appear to him.
>
> I get back in and he appears in the store again and suddenly I'm there.

Infra · Backpacks and heavy load

Heavy orders (16 caguamas + 8 cans). Backpacks break; box project in progress.

Source: Courier

Quotes:

> The backpacks don't hold much weight, we have to have them reinforced and everything.
>
> In two orders you are already full to the tank and maybe you still have one closer.

Infra · Climbing stairs vs customer experience

Debate: commercial wants them to go up; courier says that with heavy load it is impossible. Push to notify resident.

Source: Courier

Quotes:

> There are times when we bring a carton in the tank and the same client asked for 16 loggerheads and 8 cans, because there is no way for one to go up.
>
> A notification would be good, a push to say hey, if you're in a low department or something subtle.

Puebla cross-store patterns

[Critical] Seller app freezes / no order sound — missed and expired orders

Category: Bug · *Stores:* Forjadores, Zavaleta, San Jerónimo

App kicks out of seller during peak, map goes blank, or orders arrive without sound. Sellers refresh every 2–3 minutes; some orders expire before they notice.

Why it matters: 3/5 stores. Direct impact on expired orders, dispatch SLA and revenue — especially when seller is on the floor or restocking.

> When there are many orders the table freezes... the map takes a minute to load and stays blank. (Forjadores)
>
> It closes on me four or five times a day — three or four minutes without noticing and orders pile up. (Zavaleta)
>
> It doesn't sound — I have to refresh every two or three minutes or orders show up already expired. (San Jerónimo)

[Critical] 10-minute dispatch SLA vs courier availability

Category: Operation · *Stores:* Forjadores, Zavaleta, Talabera

Order may be ready in 2–3 minutes but sits waiting for a courier 10–15 minutes. Dispatch metric penalizes the store even when delivery SLA is met.

Why it matters: Structural mismatch between prep time and staffing. Sellers want SLA to reflect 'ready to go' vs 'courier picked up'.

> I already have the order prepared in three minutes but no courier — my dispatch SLA gets hit. (Zavaleta)
>
> 40 orders for 8 couriers in five minutes — impossible to have 15–20 riders. (Forjadores)
>
> Two couriers, two orders each — we still hit 35 min delivery but dispatch suffers. (Talabera)

[High] Overlapping / routing — orders go to wrong POC or flood one store

Category: Product · *Stores:* Forjadores, Jalpan, San Jerónimo

Nearby customers routed to distant stores; when neighbors turn off SKUs, volume collapses onto one POC. New stores lose orders to older ones in the same zone.

Why it matters: Puebla-specific: inter-POC spillover when SKUs are off, plus polygon too large on late hours (40–50 min rides).

> When Zavaleta or San Jerónimo turn off Victoria Mega, everything lands on me. (Forjadores)
>
> Clients 5 blocks away get routed to other POCs and complain about 30–40 min waits. (Jalpan)
>
> Late-hours polygon sends riders to La Paz del Sur — I lose a courier for two hours. (San Jerónimo)

[High] Promo lead time vs supply delivery (1 day notice, 4-day stock arrival)

Category: Operation · *Stores:* Forjadores, San Jerónimo, Jalpan

World Cup promos escalated 30→50% Corona with little notice. Supply arrives once a week (often Tuesday only) — sellers can't stock up before weekend promos.

Why it matters: Recurring desabasto on Corona Mediana. Sellers over-order when warned; miss volume when promo drops same-day.

> They told us Friday about 50% Corona — I ordered 250 cartons but still ran out on Mexico match day. (Forjadores)
>
> I order Friday, delivery comes Tuesday — promo runs Saturday and I'm empty. (San Jerónimo)
>
> If they released promos 11pm–12am we'd do 25–30 orders instead of 10. (Forjadores)

[High] 7-day KPIs only — no daily or hourly operational view

Category: UX · *Stores:* Zavaleta, Talabera

Top Stores locked to last 7 days. Sellers want yesterday's numbers and orders-per-hour / couriers-per-hour to staff peaks.

Why it matters: Strong performers still can't drill into a single day. Ale shares Excel snapshots ad hoc — not scalable.

> Last seven days only — I can't see yesterday or the monthly total. (Zavaleta)
>
> Ale shared orders-by-hour in a spreadsheet — I'd love that inside the platform. (Zavaleta)

[Medium] Inventory search and portfolio navigation

Category: UX · *Stores:* San Jerónimo, Forjadores

General inventory search misses SKUs (e.g. 'modelo'). Minimum portfolio groups incomplete; sellers want brand/category tabs and bulk on/off.

Why it matters: High SKU count POCs struggle at peak when toggling promos. Combos found only by typing '+'.

> I type Corona and not everything shows — we work by SKU number. (San Jerónimo)
>
> Snack group shows 5 items when category has 20 — I flip page by page. (San Jerónimo)

[Medium] CX / ticket response too slow — want faster channel

Category: Operation · *Stores:* Forjadores, Talabera

Email tickets to CX take until next day. Sellers prefer WhatsApp or direct line for time-sensitive issues (wrong address, no code, cancel).

Why it matters: Seller resolves most disputes by calling the customer; formal ticket flow doesn't match peak pace.

> I get the email, call the client — most reports are the customer ordering the wrong SKU drunk. (Forjadores)
>
> WhatsApp was faster before — now email tickets answer next day. (Talabera)

[Medium] Cold chain — ice, fridge space, warm beer on volume orders

Category: Infra · *Stores:* Forjadores, Zavaleta, San Jerónimo, Talabera

Ice machines missing or broken; fridges fit max 5 cartons. Sellers mark 'warm' or add ice bags at own cost; backpacks don't work for 4–6 medians on one moto.

Why it matters: Weekend promo volume exceeds refrigeration. Couriers stack multiple cases on moto without backpacks.

> Backpacks don't work — we stack up to four medians with rope on the moto. (Forjadores)
>
> Ice machine broken; cold room covers us but on cartons we call the client. (Zavaleta)
>
> Five charolas max in the fridge — 10-carton orders go warm unless we buy ice. (San Jerónimo)

Puebla store interviews

Forjadores

High-volume mature POC (~100+ orders on peak Saturdays, 7–9 couriers). Oscar runs tight manual ops: route planning on map, cold priority, custom SOPs. World Cup promos saturated ops (50 orders / 8 riders). Strong satisfaction with platform overall; pain is peak tooling, overlap spillover, and user-blocking false positives.

Bug · Map and order table freeze under high demand

During peaks the seller map takes ~1 min to load, stays blank, and navigating to assign a courier kicks the user out of the screen. With 20 pending orders, assignments are delayed.

Source: Seller (Oscar)

Quotes:

> If I open the map it takes time to load and stays blank — with 20 orders they don't show up for a while.
>
> I zoom in to assign and it sends me back and forth and won't let me assign riders.

Product · Overlapping — neighbor stores offload volume when SKUs are off

When Zavaleta or San Jerónimo disable Victoria Mega or Corona Mediana, those orders route to Forjadores. Oscar absorbs multiple zones and saturates.

Source: Seller

Quotes:

> If they turn off Victoria Mega I start getting their zone — I absorb Zavaleta and San Jerónimo.
>
> I only ask that colleagues keep enough stock so when they turn off SKUs it doesn't all fall on me.

Operation · World Cup promo ramp — 40 orders / 8 couriers

Escalating Corona discounts (30→40→50%) on 24-pack drove 50+ pending orders with 8 riders. Delivered with 40–60 min calls to customers; dispatch KPIs missed.

Source: Seller

Quotes:

> On the fifth match 50% on Corona from 24 pieces — 50 orders for 8 couriers, we called customers we'd take 40–60 min.
>
> Thank God Mexico didn't advance — it would have been brutal.

Product · User blocking flags legitimate high-volume clients

Mayordomos, barberías with cantina, and colombianos placing multiple nearby orders get blocked as fraud. ~20% of volume is Modelo-channel resellers when truck doesn't come.

Source: Seller

Quotes:

> They blocked the mayordomo — he does 8 orders/day for church events. I asked Jorge to unblock with a field visit.
>
> When the Corona truck doesn't pass, 20% of my clients are other stores buying cold beer from us.

UX · First-order badge — actively prioritized

Team ships first-time customers first to protect experience; repeat customers understand 35-min window.

Source: Seller

Quotes:

> If I have three orders and one is first order — send that one first for the best experience.

Product · Late-night promos (11pm–12am) — untapped volume

Store open until midnight; customers rush last orders. Promo push before close could 3× orders (10 → 25–30).

Source: Seller

Quotes:

> If you dropped a Victoria Mega promo 11–12 before we close we'd go from 10 to 25–30 orders.

Operation · Peak courier incentives

Extra pay during World Cup brought riders who wanted to watch the match. Would hire 1–2 more peak riders with structured bonus.

Source: Seller

Quotes:

> If you paid an extra incentive I could hire one or two more riders for peak — but my full-timers don't want to share trips.

Infra · No backpacks — stack up to 4 medians on moto

Delivery bags useless for beer volume. Riders rope 4–6 medians per trip; routes planned manually on map.

Source: Seller

Quotes:

> With backpacks we're just playing — we throw up to four medians with rope on the moto.

Operation · CX disputes resolved by phone, not ticket

Email reports mostly drunk customers confusing Victoria Familiar vs Mega. Oscar calls client directly faster than CI loop.

Source: Seller

Quotes:

> They ordered Familiar thinking it was Mega — I call and they say sorry, can I change the report?

Product · Channel to propose regional SKUs (e.g. Cholula snacks)

Wants a direct line to upload local products (e.g. 'chidas' chips) without depending only on Ale.

Source: Seller

Quotes:

> I'd like a group where we upload 'I have this product' and someone puts it on the platform.

Zavaleta

Strong KPIs (~12 min delivery). Three trusted couriers + owner on car when needed. Seller app closes 4–5×/day without sound — main operational risk. 10-min dispatch SLA hurts when order is ready but no rider. Wants hourly orders/reps chart inside platform.

Bug · Seller session closes silently — 4–5 times per day

App exits to background without alert; 3–4 minutes pass before seller notices and new orders stack up.

Source: Seller

Quotes:

> It closes on me at least four or five times a day — no sound, I'm stocking and suddenly three orders are waiting.

Operation · Dispatch SLA penalizes ready orders without courier

Order prepared in 2–3 min but all riders on route; waits 15 min for return. Dispatch metric red, delivery still under 35 min.

Source: Seller

Quotes:

> I had it ready at 3 minutes but no courier — at 15 minutes the rider arrives and dispatch already looks bad.

UX · 7-day KPI window — no daily or monthly view

Cannot see yesterday alone or month-to-date in Top Stores. Relies on Ale for hourly Excel exports.

Source: Seller

Quotes:

> Last seven days only — if I want yesterday or the month I can't.

UX · Wants orders-per-hour and couriers-per-hour in app

Ale shares heatmap-style spreadsheet; seller wants it native to plan staffing and explain pressure to riders without friction.

Source: Seller

Quotes:

> Orders per hour and couriers per hour — that data helps me staff and show the team why we're pushing.

UX · Cannot assign second order to courier on route

When rider leaves with one order and another drops nearby, no way to attach it — hurts dispatch unless rider manually takes it (stats issue).

Source: Seller

Quotes:

> He's leaving with one and another falls next door — I'd love to send it with him but the app won't let me.

UX · First-order flag visible — prioritized

Free shipping / first order badge shown; team gives priority same as other Puebla POCs.

Source: Seller

Quotes:

> First user order shows on screen — we prioritize it.

Operation · Uber vs TaDa courier economics

Peak helper works Uber — bonuses, rain surge, gold/silver tiers. TaDa single-category but lower peak earnings.

Source: Seller

Quotes:

> On Uber he gets 50 orders and chooses — rain bonuses, tier commissions. Here it's beer only.

Infra · Ice machine down — cold room backup

Ice maker not working; 100-carton cold room covers daily ops. Never ran out cold yet.

Source: Seller

Quotes:

> Ice machine doesn't work but the cold room has ~100 cartons — we haven't failed on cold.

Operation · Barcel / Sabritas supply route unreliable

Route rep changed or on vacation — 2–3 weeks without snack refill. Returns 45 pieces when forced full load.

Source: Seller

Quotes:

> Barcel hasn't come in two weeks — I returned half the stand. They arrive 5–7pm when I need volume.

Jalpan

POC since Nov 2024 (~450–600 orders/month). Owner was Lima rep before investing. Strong stock discipline. Main pain: algorithm sends nearby clients to other POCs (late delivery); believes newer store gets less priority than veterans.

Product · Routing — nearby orders go to other POCs

Clients Oscar recommended install app but orders route elsewhere; 30–40 min waits while Jalpan could serve in minutes.

Source: Seller

Quotes:

> They live five blocks away, order, and it doesn't show my store — they get 30–40 minutes from another POC.

Product · Algorithm may deprioritize newer POC

Neighboring stores with longer tenure get more orders despite Jalpan having stock and proximity.

Source: Seller

Quotes:

> I don't know if it's because I'm newer — others nearby have more orders than me with the same stock.

Operation · No multi-order trips — time doesn't allow

Tried 2–3 orders per rider early on; abandoned. Peak Saturday uses 5 riders, one order each.

Source: Seller

Quotes:

> We used to group two or three but we don't have time anymore — Saturday everyone takes one.

UX · First-order label — same priority as others

Sees 'first order' badge; team treats all orders equally (doesn't skip queue for new users).

Source: Seller

Quotes:

> First order shows — we give all orders the same importance.

Infra · Fridge fits 5 cartons — warm delivery on volume

10-carton requests exceed fridge; courier explains on arrival. Promo carton orders common.

Source: Seller

Quotes:

> Max five cartons in the fridge — when they order ten we send and the rider explains.

Operation · Rain — boots, no platform incentive

Unlike some POCs, pays personal bonuses in rain; never closes for weather.

Source: Seller

Quotes:

> We go out in rain with boots — I give bonuses, we don't stop.

Product · World Cup redemption drove new users

Canje promo brought first-time customers scanning for free six-pack; tapered after first scan.

Source: Seller

Quotes:

> At first many came for the free six-pack scan — later it was mostly six-packs not singles.

Talabera

Small team (2 couriers weekends). CX ticket response via email too slow — wants WhatsApp-style channel. Promo comms OK via groups + Ale DMs. Prints flyers for customers unfamiliar with app.

Operation · CX ticket response slow — email next day

When customer won't answer or code fails, email ticket doesn't resolve in time. Previously WhatsApp group was faster.

Source: Seller

Quotes:

> I report no code / no answer — response comes next day. WhatsApp used to be faster.

UX · Promo comms — groups OK but prefers Ale DM

National + local WhatsApp groups work; personal message from Ale ensures visibility when busy.

Source: Seller

Quotes:

> Ale forwards to me personally — easier than reading every group message.

Operation · Printed flyers for non-digital customers

Customers walk in not knowing app — team prints pollotitos with instructions.

Source: Seller

Quotes:

> We print little flyers so customers know how to order.

UX · Limited KPI use — checks delivery time visually

Doesn't deep-dive Top Stores daily; would like dispatch/delivery times more visible in platform.

Source: Seller

Quotes:

> I look at delivery time roughly — having times in the platform would be more comfortable.

Infra · Ice via bags — no machine

Uses cooler + ice bag per order when needed.

Source: Seller

Quotes:

> We have the cooler and put an ice bag so it arrives cold.

UX · First-order prioritization

When swamped, first-time users go first; two orders per rider max.

Source: Seller

Quotes:

> If we have something to give we prioritize first order — two orders per courier max.

San Jerónimo

Early TaDa adopter (ex-Modelorama Now), two POCs, 10–12 staff. Loyal couriers on weekly base pay. Critical pains: no order sound (expired orders), supply only Tuesdays (4-day gap), info overload in WhatsApp groups, broken inventory search, oversized late-hours polygon.

Bug · No order alert sound — expired orders

Seller must manually refresh every 2–3 min while restocking or on floor. Internet drops also cause missed/expired orders.

Source: Seller (Luis)

Quotes:

> It doesn't sound — I'm restocking 10 minutes and orders show up expired.
>
> When internet fails we don't know until an order is already expired.

Operation · Supply once a week (Tuesday) — promo mismatch

Orders Friday, arrives Tuesday; weekend promos announced Thursday/Friday with no stock pipeline.

Source: Seller

Quotes:

> I order Friday, they deliver Tuesday — promo runs Saturday and I'm empty.
>
> I'd need Monday + Friday deliveries — never only Tuesday.

UX · Information overload — dozens of WhatsApp groups

Modelorama + TaDa + regional groups; promo calendar lost in noise. Wants Ale as single filter.

Source: Seller

Quotes:

> So many groups I honestly can't read everything — I miss promos.

Product · Late-hours polygon — distant zones

Orders to La Paz del Sur tie up rider 40–50 min; second order same zone loses another rider for 2 hours.

Source: Seller

Quotes:

> Late hours they send me very far — one rider gone two hours, then another order same zone.

UX · Inventory search unreliable

Typing 'modelo' or 'corona' doesn't return expected SKUs. Combos found only with '+' search. Minimum portfolio groups incomplete.

Source: Seller

Quotes:

> I type modelo and it never appears — we search by SKU number.
>
> Snack group shows 5 of 20 — I page one by one.

UX · Wants alphabetical / brand portfolio tab

General inventory is chaos; minimum portfolio groups help but need ordered brand view or replace with measured SKU list.

Source: Seller

Quotes:

> Ideal: brand tab, alphabetical — or replace this tab with the SKUs you actually measure.

Operation · Manual add-on delivery skews SLA stats

When rider passes gas station next door, seller sends order manually — platform thinks slow dispatch though client is happy.

Source: Seller

Quotes:

> Order next to the gas station — we send it but stats think we're doing something wrong.

Infra · No marketplace cooler — warm when charolas sell out

Bought own fridge; no space for Pepsi/marketplace mix. Buys ice bags ~8×/month for warm beer cases.

Source: Seller

Quotes:

> No marketplace fridge — when charolas run out we send warm and buy ice, costs me money.

Product · World Cup promo — sold 40 + 20 cartons if warned earlier

50% Corona sold out instantly; would have doubled order with one week notice.

Source: Seller

Quotes:

> One day notice — I sold 40 cartons here and 20 there. With a week I'd have ordered double.

Operation · First-order prioritization when address is new

Known addresses trusted; brand-new pins get extra care for coupon/first-user promos.

Source: Seller

Quotes:

> When the address is new we prioritize — regulars we already know.

CX meeting (CDMX)

When: 22/07/2026 · St Isidro Suites — CDMX

Participants: Product team (Vivian, Canelas) + CX leadership + Diego (new CX-only PM)

The day before, Arturo and Caro visited 5 stores; product was in 2 stores (Bahia, Mixcoac, Los Alpes, Churubusco). Objective: map CX opportunities with what we saw in the field and align priorities with Diego. Tomorrow (23/07) would be the OPS dynamics for planning 2027.

Zendesk + TADA Viewer: mirror without data retention

Agents do not have Loadmin. Integration with Beast created the TADA Viewer (copy of the 360 view), but Zendesk does not retain fields — it is only a visual mirror. Agent fills in manually. There is a lack of CRM with lifecycle segmentation: new customers and frequent customers receive the same service.

> Zendesk does not retain these fields. Right now everything is manual. The agent fills everything manually.
>
> A customer who buys more from us should be served better, they should have a specific process. Right now we don't know who is who.

Incomplete/wrong order — seller vs consumer dispute

Frequent reason for contact. CX asks for a photo, but it is not possible to validate what was missing. Scale email to store with order number, customer and product; Waiting for confirmation from the seller. If they don't respond within 2 days (before SLA 5), they offer a coupon. Inventory without quantity in stores makes things worse: seller doesn't know if the product has been shipped.

> I can receive two cokes, I'll move this over here. There is no way to validate what was missing.
>
> Another consumer says I missed it. Seller says I gave it to him. What are we going to trust?

Late order = display problem (validated in store)

Main volume of late tickets. Distributor can operate without internet; consumer map does not follow reality. During the visit: pin stopped at the store with courier already on the way. CX does not know how many distributors are offline. No notification of arrival to the consumer.

> Consumer maps do not equal reality. There we were in the store, Locur was gone 15 minutes ago and Gomapa was in the store.
>
> We have no notification of it happening, it reached the clients, we do nothing for the clients.

Seller-consumer chat: not open chat in Mexico

Chat with pre-printed messages (alert center), no free field — labor restrictions in Mexico. Goal: reduce ~40% of the volume of tickets that are currently coordinating delivery. Seller takes that part; CX becomes more technical (platform, Jira).

> Here in Mexico we cannot have a direct chat between consumer and customer... It is an alert center with an imprinted message. There is no open field to type anything.
>
> It would reduce around 40% of the volume of tickets that we receive. And the seller begins to assume that.

Fast resolution vs investigation (iFood/Didi reference)

Brazil (iFood): bot offers immediate partial coupon for missing item. Didi/Mercado Libre: photo upon delivery or consumer selects which item was missing in the app. Today TaDa asks what was missing without validation — dispute between the three sides.

> When you manage any problem with your order, it would be a bot that offers you a smaller amount... as a quick resolution proposal.
>
> Within the platform you can select which product you were missing... That currently does not exist either.

Other topics: order exchange, security, moderation

Product replacement (consumer changes their mind on the order) and a separate, more complex case. You can't blindly trust sellers or consumers. CX also deals with insults, dangerous neighborhoods (cannot force courier) — no 15 min SLA to prioritize risk.

> It's like I made an order, I changed my mind. I don't want twelve crowns, I want fourteen.
>
> We cannot trust the OK sellers and the consumer. We have to make any experience for everyone.

Links to field visits:

- GPS/map does not update - confirmed by CX as cause of delay tickets (4/4 stores)
- Inventory without quantity — prevents validating incomplete orders in disputes
- In-app chat — sellers already ask for it; CX validates pre-defined message model in MX
- Code against delivery — Mixcoac/Bahia cites reduction in complaints; CX still disputes payment

Next steps:

- Diego (PM CX) as focal point with product
- Evolve Zendesk for data retention + CRM/segmentation
- Pilot pre-defined seller-customer messages and measure impact on tickets
- Explore fast-resolution flow (partial coupon) and missing-item selection
- OPS workshop (Jul 23) to prioritize real platform problems in 2027

Product meeting

When: 22/07/2026 · St Isidro Suites — CDMX

Participants: Felipe Canelas (PM Seller/Courier/Admin), Vivian (designer), OPS leadership (Luis, Andre, Javi, Nadia, Alex) and CX

Presentation of the strategic product pillars, changes since 2025 and upcoming roadmap. The day before, the product team visited stores in CDMX; tomorrow (07/23) OPS dynamics for vision 2027. Focus: right tools for fewer people, automation and KPIs (Perfect Order, Perfect Service, free rate,

demand coverage, SLA).

Pillars, KPIs and strategic context

Prioritization by quarter (SDA, free rate, demand coverage). Mexico: fewer people than Brazil with higher quality. Target 95% Perfect Service (today ~92); 6 cities with 90% target (Torreon and Puebla reaching). 118+ changes in Seller/Courier since 2025. Current focus: growing perfect orders, demand coverage, stockout and perfect service. Free rate: consumer is primarily responsible for cancellations; changes focused on free rate single consumers. 10 cities closed (2% of the drop in orders vs last year).

> Today, consumers are mainly responsible for canceling orders.
>
> We have been 92 but we want the goal 95.

Order Flow — order summary and acceptance

Order summary reduced screens (fewer screens = faster computer). Evolution of the acceptance flow. Micro-conversions: reduction of 1.34 expected requests and an increase of 1 point lower in acceptance.

> This made it possible for stores not to do multiple screens with each one having an order.
>
> The fewer screens on the computer, the better, the faster the computers.

Map — 2nd most accessed screen

Critical screen to decide who delivers each order. Known issue: map without real-time GPS updates — also validated during store visits.

> This is the second most accessed screen of all TADA stores.
>
> We see that we have a problem with the map, it is not having updates.

Order distribution and overlap algorithm

Algorithm considers distance, clustering rate and load. Last year's test: -4 min delivery with variant B. Mexico Overlap: 25% orders (demand coverage overlap 40%; area overlap != order overlap). Brazil: 50%. Rolling hourly: last 3h, 1h gap. No real-time data from couriers — uses history (~6h). New POC: ~30-40% fewer orders than the best store. Distribution 1 in 20 to the 2nd store when the 1st operates well (tradeoff: worse SLA). Luis pending: case of canceling and not arriving at the other store.

> We have 4 minutes of agility in delivery when we use the B algorithm.
>
> Overlap of Mexico is 25%... overlap demand coverage of 40%.

OPS feedback: flexibility on peak days (Epsunan)

Andre: on the day of a football match, an overloaded store does not redistribute to neighbors. Idle couriers: 'I have no orders'. Same problem in Brazil (Epsunan). Product evaluates 2nd version of the algorithm with progressive distribution — tradeoff between SLA and fairness between stores.

> That strong operational day was lost on a typical day.
>
> The messages begin: I have no orders, how is your day?

Courier Acquisition, Seller Acquisition and Courier Financial Report

Courier App with store information doubled acquisition. Online seller landing page (request from Nadia). Courier Financial Report: weekly payment closure for couriers — widely used on Sundays. Next step: couriers information for sellers.

> We managed to double Kuhiers' acquisition levels.
>
> Sunday, Sunday, much used almost one for one.

Top Stores — ranking, prediction and competition

Initial test with Airplay in Queretaro and Monterrey. Main screen: ranking, perfect order, summary, forecast (last 7 days), best-selling products in the region. Errors in prognosis confirmed during visits — stores do not understand SLA. Sellers who see rankings perform better. Evolutions: competitor's name in the ranking, 4th/5th place award, AI tips, couriers needed per hour, emphasis on new consumers (fulfillment below average despite the banner).

> Let the forecasts be more correct because we saw in the stores that we have some errors.
>
> Some don't really understand what an SLA is.

Fleet Manager — remove delivery drivers

New function to remove couriers (before just adding them). 6,000 removals in 2 weeks vs ~100 tickets/month before. During visits: stores still do not remove inactive employees; Alphabetical list makes it difficult to find assets (2nd page).

> That caused practically 100 tickets per month to do the removals.
>
> Six thousand in two weeks delivery people from Pueblos.

TEST — How cancellation transfer works today

When 2+ POCs cover the zone and the 1st cancels/expires, order goes to 2nd (and possibly 3rd) POC. In 90% of cases the 2nd delivery. Each POC has ~4 min to accept; total ~12 min until final cancellation. Adds +2 min to average SLA. Consumer receives cancellation notification only in the final status. Typical case: store cancels due to unsafe zone — another store could deliver.

> In 90% of cases we deliver with a second POC.
>
> During the cancellation transfer we have a 2 minute growth in SLA.

TESTING — What will be tested (overlap enlarged, are canceled)

Proposal: 100% overlap or extended only for canceled orders — dynamic coverage over the existing polygon. Normal algorithm DOES NOT change for regular orders. Only the 2nd attempt uses wider coverage; max 2 POCs (no 3rd transfer). Expected impact: ~3% of orders (Puebla free rate 97%).

Recover lost orders, do not transfer active orders away. Brazil: it was a test for smart polygons, it is NOT live in big cities.

> This is for an impact on the 3% write-off.
>
> Only for canceled ones... we are recovering an order that was already canceled.

TEST — OPS risks and debates (stock, SLA, geography)

Luis: stores with disparate inventory at opposite points — stock out if SKU does not exist in the distant store; impact on SDA if they cross cities. Javi: stock at city level could benefit (<1%); store turns off SKU when it runs out. SLA: 5 km/50 pesos today vs 10 km/100 pesos; Long-distance courier loses productivity. Andre (Merida): large cities with 40-60 POCs — operational risk; fulfillment 98.5%; orders outside the sector generate tickets ('10 km, can I cancel or take it?'); intense heat — 5-8 min more = perception of hot product. Previous test Torreon/Celaya 2024 (dynamic polygons for ALL orders) did not work.

> Many orders will fall for a SKU that the nearby store probably does not have.
>
> Productivity of that delivery person will be lost by being at a fairly distant distance.

TEST — Non-consumer impact, CX and experience

With the new tool, consumers DO NOT see cancellations until the 2nd store cancels — better experience (chance of redemption). Concerned CX: tickets 'why did they cancel?' — SLA can increase from 45 to 55 min. Debate: which is worse, canceling or delaying? After 25 minutes users increase churn. Reporting a delay via push can help. Future vision Canelas: Uber-style dynamic ETA before ordering + variable delivery fee.

> With this new tool, the consumer does not find out until the second store cancels.
>
> That it is better to have a canceled order, to have an order delivered in 50 minutes, we don't know.

TEST — Fares, cities and Andre's proposal

Dynamic fare per km mandatory (Nadia/Dani align with POPs). Examples: 6 km = 70 pesos, 10 km = 120 pesos. Cities: Puebla (good stock), Tijuana (origin of the idea, SLA 91-94%), Merida (circular polygons). Andre proposes: max 3-4 stores per sector, greater dynamic overlap but not the entire city; 3 stores = little data for 3 months of testing. No one is obliged to accept orders from far away — POP decides based on available distributors.

> If it is 6 kilometers we are going to pay it in 70 pesos, if it is 10 kilometers we have to pay it in 120 pesos.
>
> Grab a maximum of three stores, four stores and try it out.

TEST — Experiment design and metrics

Duration: 2 weekends, 1 city, ~15 days total. Launch in ~2 weeks (holiday conflict). Manual and temporary configuration. Metrics: first-order retention vs rating, retention frequency, CX tickets. Guard rail for new users (first orders). After testing: take a complete solution to tech with mileage limits for the entire country.

> Two weekends, one city, one game.
>
> First one, retention versus rating, retention frequency, luego cuantos tickets levantan.

Courier Financial Report (Jumbo) — statement on platform

Weekly communication of payment for couriers directly on the Seller platform (same financial Excel). V1: summary by concept, line by line (not in order; not this year). Dream: statement requested on request + direct bank transfer (complicated: customer's bank account). OPS concern: everyone in charge of the store sees values. Store comments on visits: they want today's cut and yesterday's routes.

> Our dream is to do order by order as a banking layer.
>
> The information will be available to all store managers.

Communication: alert center, WhatsApp and Zendesk

Chat that is not chat (MX): courier-client with pre-defined messages (call, instructions, time 5/10/15 min). Customer has 5 minutes to respond. Seller receives alert if courier no response 5-10 min. Seller-customer: button opens WhatsApp on the computer (like today). Brazil: -30% tickets; 60% 'I'm here' messages. Zendesk-Brase: popup on Seller Web for CX tickets. Arrival push exists but couriers say that consumers don't see — complement. Open order: courier only; closed/incomplete: CX. Login vs communication: changing phone/email requires a new account — validate with Iya.

> Tiene forma, sabor, olor, pero no es un chat.
>
> In Brazil 60% of the reasons were I'm here, I'm here.

Notification center for sellers

In-app inbox (already in Bolivia; adds Braze). NPS, institutional communications, features, promotions by POC/city (ex: Corona 40%). Evolution: ticket backlog ('you have 50 tickets, respond'), PDFs for download, orders.

> A communication inbox... starting with sending NPS to seller.
>
> Tienes un backlog de 30. Exactamente.

Links to field visits:

- Inaccurate order forecast — Top Stores + visits (Bahia, Los Alpes, Churubusco)
- Map/GPS does not update — 2nd most used screen; confirmed in the field and in the meeting
- Remove inactive distributors — new Fleet Manager, stores are not yet using it (visits)
- Alphabetical list of couriers — makes operations difficult (Churubusco)
- Overlap/unevenness on peak days — idle couriers vs overload
- New consumers with below-average fulfillment — flag exists but they don't prioritize
- Cancellation test: stores cancel due to insecure zone — expanded overlap could rescue
- Courier statement: stores asked for a cut of the day and yesterday's routes for visits
- SLA not understood by sellers — Top Tiendas needs to explain metrics

Next steps:

- TEST cancellation: define city (Puebla/Tijuana/Merida), 2 weekends, rate per km with Nadia/Dani
- TEST: communicate SOPs that are not obliged to accept; measure retention, rating, tickets, new users
- After 15 days of testing: take results to tech (km limits nationwide)
- Launch Courier Financial Report (Jumbo) this week — weekly summary on platform
- Seller notification center — NPS rollout + communications by POC/city
- Top Tiendas: IA tips, competitor names, 4th/5th award, emphasis on new consumers
- 2nd algorithm version: progressive distribution on peak days (Epsunan)
- Validate with Iya: email/phone update vs critical login
- Dynamic OPS (23/07) for vision 2027

OPS workshop

Dynamics to build vision 2027. Phase 1: post-its of challenges by area (10 min). Phase 2: open discussion (40 min). Phase 3: friction map. Phase 4: dreams/future of the product by area (Courier, Seller, Admin, CX, Consumer). Notification center for sellers already being tested in Bolivia.

Courier

Inefficient tracking and failures to close orders — Post-it: inefficient courier tracking even with active permissions (consumer and seller). Constant failures when closing orders; orders that cannot be closed. Failures in courier app directly impact SLA.

Available vs offline — manual assignment — In the delivery app it appears available but in the system it appears offline. Error adding order to delivery person; They have to manually enter the order key. Help and support not visible in the app.

Android versions and OS updates — Luis (OPS): frequent issues may be linked to Android versions and OS updates on courier phones. Drives several post-it comments.

Real-time supervision panel (Andre) — They need a panel to see couriers in real time: routes, if they take orders, how long they take to travel. Before they had it with Tucker. Today they wait 24 hours to find out what happened on the route — without real-time corrections. Access for immediate cancellation reason.

Future: Uber-style visibility for the consumer — Consumer should see delivery person in real time. Today it seems stopped/delayed; If you leave and come back in it updates but it is not live. Uber idea: notify when a courier delivers another order sooner — calmer, fewer tickets.

Seller

Inventory: groups vs products and minimum portfolio — Managers confuse group pages with products (e.g. rum/liqueurs). They propose bold, color or drop-down list by group (Coca-Cola displays everything). New POCs don't know a catalog — they need filters. The first thing they see is general inventory; You should see the minimum portfolio first. Operating incentive pays for groups on, not for individual SKUs. Unmissable SKUs section by city.

Invisible store PIN on map and coverage — Seller does not appear in map PIN or coverage. In My Account they do not see real coverage with PIN. When assigning order they do not see where the store is.

Unfriendly inventory management — Complicated process: visualizations, SKUs that appear/disappear. Inventory slow to update. Completed orders continue to appear. Without reassigning orders in emergency. Excessive weight for deliveries. Filters by brand, sub-brand, highest to lowest inventory.

Returnables and automatic variant activation — If you have a returnable or non-returnable button, the other one is automatically turned on — very hard management. Filters by brand would help. You cannot download the entire file of PIN-enabled SKUs.

Consola admin tipo Armis/Vitex (Luis) — OPS needs to enter seller by seller with credentials (which change). Before on Vitex/Armis: store code, see live inventory. Proposal: mirror without asking each seller for a bag of credentials.

Automatic combos and creation module (Armando) — If store has 3 combo SKUs on, create automatic combo; if one goes off, undo combo. Module to select parts (3+ years ordered). Today: Create SKUs that add value, manual breakdown, only 6 of 200 active combos. GMB combos grew 30-40% but represent 10% today. Profit goes to Marketplace instead of Beer.

Seller KPIs: SLA 35 min and time filters (Daniela) — Seller view should show % deliveries in 35 min or less. Filter not only 7 days — monthly, previous day, etc. Personalized breakdown of price differences and shipping costs for business owners.

End-of-day close with SKU detail (Andre) — Entrepreneurs need daily counting: folio, SKU, cost per SKU to cross-reference with their system. They only see amounts and orders without details. Detected losses of 25-30 thousand pesos/month due to embezzlement in stores.

Outdated manuals and training — Seller page with manuals from 2 years ago. They need updated videos and infographics integrated into the platform. Training section with the most important things.

Future: inbox, notifications and voice of consumer — Notification/inbox when new SKU or combo available (click here). Current promotions of the week in one place. Notification center (Bolivia test, Braze). Voice of consumer box: problems that customers report in your store. B2B report delivery people needed per week.

Admin

Polygons: see coverage of the neighboring POC — When modifying polygons you have to check street by street to splice. They need to see POC coverage next to them when modifying to close white space.

Seller acquisition: bulk download and incorrect data — Registration landing active but you have to enter one by one to get data. Some enter incorrect information and the lead is lost. Onboarding asks for too many fields (~10). Very bad initial board.

Heat map and order concentration (Nadia) — Ultra laborious process: download data, upload to Kepler, use 3 map programs. They need to visualize concentration of orders in coverage. They detected fraud (90 chips per POC) with this manual work. Mass download of maps coverage; filters changed and lost visualization.

Admin coupons unlinked from categories — Coupon admin not linked to product categories. Categories that appear are old (Cuca). Loading coupons with unique codes very manually. First purchase coupon abuse with multiple accounts.

SKUs deleted without notice — Massive shutdown of obsolete SKUs, eliminating 24 combos from the world cup that they used. They had to recreate it without knowing if they lost data. They need to protect SKUs that they use in promos.

Braze communications verification/encrypting — CX does not know if the user received the coupon/communication. They need to get Braze history by specific email to verify.

CX

Without visibility of what the consumer sees — CX cannot see wallet, points, consumer screen. They always ask for captures — annoying ('if you can't see, they'll wait for me'). No personalization: new and frequent drinkers receive the same attention.

Disconnected ecosystem and blind map — Without internal communication between CX, seller and courier. CX does not see the courier's map or location — 'completely blind' to guide or calm the consumer.

Mandatory and visible cancellation reason — Marcela wants to see the reason for each cancellation/expiration in her system. Reason 'other' with free text is lost — it does not reach CX. Useful for rain, without distributor, etc.

Delivered not received and completion options — High impact category in tickets. Delivery driver has 3 options to dial endlessly — CX wants only 1. Delivery PIN low volume but cases persist.

Consumer cancellation = 20% tickets — Top reason for contact: I want to cancel (wrong address, change product, I no longer want). Proposal: modify direction on the perimeter (500m-1km) without canceling. Block/delay users who cancel 2-5 consecutive times within the first minute.

Decision tree and unified view (Uber/iFood style) — Benchmark Uber: decision tree for complaints without reaching a human. iFood DC Delivery already has it. Vitex-style proposal: an account to view inventory, orders, map of any seller without credentials. Ticket history per consumer does not exist. Branded calling (TaDa logo when calling).

WhatsApp and notifications without background — WhatsApp main MX channel but without notification in the background. Email communication between platforms is slow. Late/store order push does not arrive if the consumer is not in the app.

Future: AI bots, SLA as support and integrations — Resolving AI bots for team management and communication. SLA is not always a problem to solve — TaDa should be a technological tool that helps entrepreneurs sell. Complicated Braze/SLA data integrations with third parties (NTT Data).

Consumer

App crashes on peak days and massive promos — World: app collapse, CSAT very low for 2 months. Friday fortnight, massive events. Strategy was to anticipate demand with aggressive discounting. There was no 'we are collapsing' alert. 80% Corona discount — courier and app collapse.

Loading times and weight of the app — 8-9 second load with animation before main screen. App has weighed up to 3 GB. Users in focus groups: it is not accessible, it is not easy to use.

Onboarding y cupones — Verification SMS/WhatsApp does not arrive — acquisition traffic is lost. Coupon difficult to apply for recurring user ('I already have an active coupon, how do I add it'). First abuseable purchase with multiple accounts.

Cart, update and failures by device — Nobody knows what to enter number and delete to remove product from cart. Forced update only when there is a problem — you should be proactive as a bank. More failures on iPhone in the world. Confusion between network failure and app failure.

Future: live map, blocking update and payment — Force update blocking purchase if outdated version. Functional real-time delivery map. Card payment/PayPal stuck — gift ideas (birthday crowns). GIFs in promotional banners (Brace images only). AI to explain T&C and promotions.

Comercial / Marketplace

Aisles and rampages without editable priority — Category aisles cannot be prioritized even if they change position. Beer promotions go to the bottom. Rampages without editing access — duplicate work (hallway + rampage for new Tigres can).

Commercial communication via WhatsApp unsustainable — Each new product requires art + message to groups. Many groups (national, city, ops, failures, commercial). Entrepreneurs saturated with messages. Central inbox would solve it.

Retention and acquisition (Carol / Itamar) — Carol: capabilities for long-term retention. Itamar: acquisition of users and orders, owner Marketplace. App must be ready for any promo volume.

Internal process / Supervision / OPS

Real-time KPI cockpit (Daniela / John) — Admin master console: view inventories, orders, SLA, free rate by POC without logging into each seller. Update every 1.5-2 hours acceptable. John I think Power BI view — they need it for weekends and on call. Detect new POCs that are stuck.

Stock audit and slow commercial reaction — OPS audits stock entering seller by seller. Commercial creates new SKU with potential but operational activation is slow and manual. Combos and promos complicate management.

Friction map: rework between areas — Session included friction map: recurring pains, bottlenecks, rework, noise points between areas, moments when operations break.

B2B report and AI delivery suggestion — B2B report for POC to know how many delivery drivers you need next week. Benchmark Uber Eats with AI for POC supervisor. Automatic suggestion according to weekly order growth.

Inaccurate pedal forecast — Mentioned in dynamics: forecast 20-40% error. They need a more precise stage; Bad forecast generates chain of bad experiences (turn off/reprimand in matches).

Promo workshop

The commercial team runs promotions across a fragmented toolchain (Excel, Trello, VTEX) with heavy manual coordination. Key needs: centralize planning and documentation, reduce spreadsheet dependency, improve Flash Promo configuration and reuse, standardize rules across markets, and strengthen campaign traceability and measurement — making the operation more efficient and scalable.

Seasonality drives promo calendar

Key commercial dates anchor the promo calendar: Hot Sale, Buen Fin, Christmas, and other seasonal peaks. Planning starts from these fixed moments.

Competitive analysis and benchmarking

Team monitors what competitors are doing in the market to stay relevant and decide promo mechanics.

Inventory rotation and liquidity

Promos used to move slow-rotating stock and improve cash flow — inventory management is a direct input to promo ideation.

Brand and retailer partnership requests

Specific requests from partner brands and commercial agreements generate promo ideas — coordinated with KAMs.

New launches and catalog differentiation

Growth goals and new product launches drive promotional mechanics to differentiate the catalog.

Marketing + commercial brainstorming

Internal collaboration between marketing and commercial teams in brainstorming sessions — ideas not yet centralized in a single tool.

Excel for scheduling and impact projection

Calendarización and projected promo cost/impact calculated in Excel spreadsheets — primary planning tool today.

Trello for KAM / brand alignment

Trello boards used to align promotion plans with Key Account Managers of different brands. Fragmented from Excel calendar.

Monthly review meetings with planners

Regular monthly meetings with planners and commercial staff to define upcoming promo focus — coordination-heavy, no single platform.

Goals and budget defined by category

Strategy sets promo goals and discount budgets per category — but tracking execution against plan is manual.

No centralized planning documentation

Planning spread across Excel, Trello, meetings, and WhatsApp — difficult to trace decisions, reuse past campaigns, or onboard new team members.

Requirement: centralized promo planning hub

Single place for calendar, K-plan alignment, budget, documentation, and approval status — replacing spreadsheet + board fragmentation.

Promo by category or brand — not only SKU

Need flexibility to configure promotions at category or brand level instead of configuring each SKU individually.

Bundle / pack promo support

Platform must support configuring promotions for product bundles and packs — common mechanic in commercial campaigns.

Bulk SKU upload — high manual error rate

Bulk upload process generates frequent manual errors. Need validation layer before upload to reduce rework.

VTEX upload friction and technical errors

Explicit pain point: problems and delays when uploading promotions to VTEX — technical bottleneck in execution.

Automate margin calculations

Margin calculations done manually during planning — automation would speed up approval and reduce errors.

Flash Promo: Quantity type

Dedicated Flash Promo mechanic with quantity limits — e.g. first N units at promo price. Separate from discount-only flash.

Flash Promo: Discount type (TIME + DISCOUNT)

Flash Promo with real-time countdown timer and time-limited discount — distinct configuration from quantity-based flash.

Reuse and template Flash Promos

Improve configuration and reuse of Flash Promos — today each campaign requires manual rebuild. Templates would scale operations.

No visibility into promo impact on conversion funnel

Cannot see how active promotions affect the conversion funnel — limits ability to optimize mechanics during campaign.

Results dashboard not intuitive enough

Dashboard of results exists but is not intuitive for quick adjustments to active mechanics mid-campaign. Needs real-time tracking.

Requirement: real-time campaign tracking dashboard

Dashboard de acompanhamento em tempo real — monitor ROI, orders, and category performance as campaign runs; enable quick mechanic changes.

Standardize rules and homologations between markets

Promo rules differ between markets — need standardized configuration and homologation workflow for scalable operations.

Prioritize actions by strategy and scale

Need to prioritize promo actions within commercial strategy by size/scale (mono, pg, mg) — currently ad-hoc.

4. Peru

Visit executive summary

Across 3 Lima POCs, the same structural gaps repeat: map/GPS unreliable, inventory without quantity, broken search, and no seller–customer channel — with WhatsApp as the real ops layer.

La Marina (Pueblo Libre, ~400 orders/week) is the reference POC in the group: best SLA and TML in KPIs, multi-store supervisor with cameras + WhatsApp control room. Merino (Lince, smallest volume) absorbs neighbor spillover when other POCs turn off SKUs — +70 orders on a weekend when coverage moved. San Pedro (Surquillo, highest volume, ~150–200 orders on Saturday) runs 7 couriers 18h/day in a tight 3.5 km polygon with strong SLA but the lowest TML 10 in the visit set.

All three stores report the map does not update in real time: courier pin stuck at the store after leaving, only 1 of 15 riders visible on a Saturday, filter “en ruta” useless. Workaround everywhere: WhatsApp groups asking couriers to share live location. La Marina quantifies visibility at 5–10%; Merino says it used to work and stopped; San Pedro calls real-time updates the #1 fix.

Inventory is the second universal pain. On/off does not reflect real stock; there is no quantity field (VTEX/Tuca had it). Combos and linked SKUs do not turn off together — a turned-off Flor de Caña still accepts orders through another combo SKU. Search misses Pilsen, 473 ml, “cerveza” vs “Pilsen 630”. Turning off a SKU does not always block new orders (reported at La Marina and San Pedro). Sellers want a parent SKU that disables all variants and auto-decrements.

Communication gaps drive cancellations and bad ratings. No in-app seller–customer chat (had it in a previous tool). Customers do not update phone/WhatsApp; couriers wait 10–15 min at the door. Deposit-bottle confusion (“tengo/no tengo botellas”) generates disputes and 1-star ratings — La Marina estimates 4–5 of 50 orders. Merino sees clients cancel 10–12 times in a row to route the order to a preferred POC (overlap + store name visible in app).

Operational tooling that works: WebPO (demand by hour, couriers needed, weekly payments) is praised at La Marina and Merino — updated Mondays, helps staff peaks for football and holidays. Gaps: promo notice arrives in consumer app but not BEES/supply; KPI screen locked to rolling 7 days (not Mon–Sun); ranking peer set opaque; SLA 35 hidden in seller platform. La Marina’s top 3 asks: stock quantities, assign second order to courier already en route, seller activates couriers (not self-activate every 30 min).

Stores 3 · Insights 31 · Critical themes 2

POCs visited

La Marina

PC La Marina - Pueblo Libre E0 · Pueblo Libre · 4095 orders · Fill 95.88% · SLA35 99.65%

- TML 10 dropped 5.1 pp from Jul to Aug (95.4% → 90.3%)
- 38.6% of cancellations attributed to courier
- Best SLA 35 (99.7%) and TML 10 (92.6%) in the visit set
- Fill Rate stable ~95–96% across Jun–Aug
- Stockout ~1.4% — lowest of the three stores

Merino

PC Merino - Lince E0 · Lince · 763 orders · Fill 95.38% · SLA35 93%

- SLA 35 at 93.0% — below the 95% target
- Stockout 4.4% and SKU availability 68.4% — weakest assortment of the three
- Smallest fleet: 13 couriers (6 regular)
- Highest order rating (4.94) and availability (99.2%)
- Stockout fell in recent weeks (8.4% → 1.4% in weeks 32–34)
- Fill Rate 95.4% — on par with La Marina

San Pedro

PC San Pedro - Surquillo E0 · Surquillo · 4210 orders · Fill 94.16% · SLA35 94.35%

- TML 10 at 36.8% — by far the lowest in the visit set (La Marina 92.6%)
- Seller share of cancellations is 12.2% vs 0.6–3.1% in the other stores
- SLA 35 slipped from 96.4% in Jun to 94.4% in Aug
- Highest volume of the visit (4,210 orders)
- TML 10 is recovering: 24.7% → 36.7% → 42.4% (Jun–Aug)
- Stockout 1.9% after a 9.4% spike in early Jun

Cross-store patterns (Lima)

[Critical] Map / GPS does not update — courier pin stuck at store

Category: Bug · *Stores:* La Marina, Merino, San Pedro

Seller map does not show couriers moving in real time. After delivery the pin may still sit at the store. On peak only 1–2 of 15 riders visible. Filter “en ruta” does not help. All three stores route-track via WhatsApp.

Why it matters: 3/3 stores. Same pattern as CDMX/Puebla Mexico visits. Blocks dispatch decisions at peak and erodes trust in Top Stores / map screen.

> Of 15 couriers I can only see two — the rest I track by WhatsApp. (La Marina)
>
> The courier already delivered but the map still showed him at the store. (Merino)
>
> I filter en ruta to see the route and it still shows the courier at the store — it never updates. (San Pedro)

[Critical] Inventory without quantity — search broken, combos don't turn off together

Category: Product · *Stores:* La Marina, Merino, San Pedro

On/off does not reflect real stock. No quantity field; sellers count manually at night. Search misses formats and brand names. Turning off one SKU does not disable linked combos. Orders still arrive on turned-off SKUs.

Why it matters: 3/3 stores. Direct link to stockout, seller cancellations (San Pedro 12.2%), and peak slowdown. VTEX/Tuca had quantity + combo codes — explicit benchmark.

> If I turn off Flor de Caña but a combo with another name stays on, the order still comes in. (La Marina)
>
> I write cerveza Pilsen and it doesn't detect it — there goes a combo I forgot to turn off. (Merino)
>
> I turn off the SKU and half an hour later the same product order arrives anyway. (San Pedro)

[High] No seller–customer communication — WhatsApp and cancellations

Category: Operation · *Stores:* La Marina, Merino, San Pedro

No in-app chat like Rappi/Uber. Sellers and couriers call/WhatsApp the customer; many don't answer or have outdated numbers. Deposit-bottle disputes hurt rating. Merino: clients cancel repeatedly to force routing to preferred POC.

Why it matters: Validates Mexico CX/product direction for pre-defined messages. Peru sellers remember having direct customer chat in a previous tool.

> The customer doesn't come out, we have no way to communicate — we have to cancel. (La Marina)
>
> The client can see which store got the order and cancels until it lands at their friend's POC — 10, 12 cancellations in a row. (Merino)
>
> Like Uber — a direct message with the customer would be a good option. (San Pedro)

[High] Can't assign a second order to courier already en route

Category: Product · *Stores:* La Marina, Merino

When the same customer places two orders or a nearby order appears, seller cannot add it to the courier who is already leaving. Must send a second rider. Tuca allowed re-assignment; current platform does not.

Why it matters: La Marina supervisor's #2 priority. Wastes couriers in dense zones (Pueblo Libre, Surquillo). Tied to map not showing overlapping pins.

> The client orders again while the courier is leaving — I have to send another rider instead of adding the order. (La Marina)
>
> In Tuca if I gave an order and another came nearby I could add it — here I can't. (La Marina)

[High] Order sound unreliable — missed and expired orders

Category: Bug · *Stores:* Merino, San Pedro

Notification sound works intermittently. Seller restocking or alone on shift misses orders. Merino and San Pedro both report the pattern; San Pedro on quiet Mondays with 4 staff and 6 orders.

Why it matters: 2/3 stores explicitly. Same class of bug as Puebla/Zavaleta. Revenue loss when nobody notices for 1–2 minutes.

> Sometimes it sounds, sometimes it stops — you turn around and an order was already there a minute ago. (Merino)
>
> Two orders came in while I was picking and it didn't sound — I lost an order. (San Pedro)

[High] KPI screen: rolling 7 days, opaque ranking, SLA 35 hidden

Category: UX · *Stores:* La Marina, Merino, San Pedro

Top Stores shows last 7 days rolling — not Mon–Sun calendar week. Sellers can't filter by date or see yesterday only. Ranking compares to unknown peer set (#32 of ?). SLA 35 % not shown in seller platform (hidden because low). Availability metric stopped loading.

Why it matters: Same ask as CDMX/Puebla daily KPIs. Merino waits until 9pm for WhatsApp dashboard from ops. San Pedro stuck at rank 32 without knowing the algorithm.

> It pulls the last 7 days no matter what — I want Monday to Sunday like before. (La Marina)
>
> SLA 35 doesn't appear here — we hid it because it was low, but that's what I need most. (Merino)
>
> We're always #32 — we don't know what we're missing to move up. (San Pedro)

[High] Overlapping / inter-POC spillover when neighbors turn off SKUs

Category: Operation · *Stores:* Merino, La Marina

When nearby POCs disable best-selling SKUs, volume floods the POC with inventory. Merino (+70 orders weekend). Clients also game routing by canceling until order hits preferred store (bar in front of POC).

Why it matters: Connects to morning context meeting Fill Rate and Peru expansion (multi-POC owners). Not just algorithm — consumer sees store name in app.

> The other POC runs out of product, turns it off, and all those orders land here. (Merino)
>
> The bar across the street orders until it hits our POC — otherwise they cancel. (Merino)

[Medium] Courier assignment bugs and seller-controlled activation

Category: Product · *Stores:* La Marina, Merino

On peak, assign-to-courier freezes: key sent but order stuck in waiting, courier never receives. Couriers self-activate and auto-off every 30 min — seller wants to turn riders on and assign directly. Courier acquisition page exposes store phone (midnight calls).

Why it matters: La Marina #3 ask: seller activates couriers. Fleet Manager removal exists in MX — Peru wants the inverse (activation control).

> I send the key to Juan and it stays waiting — on his phone it never appears. (La Marina)
>
> Every 30 minutes it turns off — I want to activate them and assign, not wait for them to come online. (La Marina)
>
> Couriers register and get a suggested store with the phone number — they call at 2am. (Merino)

[Medium] WebPO valued — demand forecast and payments; promo notice missing

Category: Operation · *Stores:* La Marina, Merino

Internal WebPO (demand by hour, couriers needed, weekly payment upload) praised. Helps football, holidays, staffing. Gap: consumer promo visible in app but not BEES — seller can't stock before demand spike. Notifications in WebPO still in pilot.

Why it matters: Positive signal for seller notification center + commercial calendar integration. La Marina pilot since April, all Lima from July.

> If there's a promo on Stella at 23 soles the app tells the customer but BEES doesn't alert me. (La Marina)
>
> Demand by hour and how many couriers we need — this helps a lot for match days. (La Marina)
>
> Payments used to go by WhatsApp — now they're here for everyone. (Merino)

[Medium] Returnable volume, weight limits, improvised cold chain

Category: Infra · *Stores:* Merino, La Marina

~60% returnable orders. Official bag fits 1 carton; couriers stack 2–4 with rubber bands. Promo 28-pack for Fiestas Patrias pushes weight. Ice/cooling for six-packs manual. Not blocking but drives courier complaints and risk.

Why it matters: Peru differentiator vs Rappi (returnables). Product/ops constraint on promotions and backpack design.

> They hate the 28-bottle promo — bottles explode, four go loose in the bag. (Merino)
>
> I've seen a courier carry four cartons — I didn't even ask how. (Merino)

Store interviews

La Marina

Reference POC (~400 orders/week). Store manager supervises three locations (La Marina, Democracia, La Perla) via WhatsApp + CCTV. Strong KPIs; heavy WebPO user since pilot. Operation is manual at edges (inventory count, courier WhatsApp tracking) but disciplined. Top pain: map visibility, no stock quantity, can't stack orders on courier en route.

Bug · Map: courier pin stuck, ~10% visibility on peak

On Saturdays with ~15 couriers, only 1–2 appear on the map. Pin stays at store after courier leaves. Seller uses WhatsApp groups for live location. Same two orders at same address can't be seen on map — uses receipt name instead.

Source: Store manager (multi-POC supervisor)

Quotes:

> I'd say until it's 100% visible it's 5%, 10% — of 15 couriers I only see two.
>
> We have WhatsApp groups where we ask all couriers to send their location in real time.

Bug · Assign-to-courier fails on peak — order stuck waiting

When bill overflows or platform slows, seller sends order key to courier but it stays in waiting — courier never receives. More frequent on high-demand days.

Source: Store manager

Quotes:

> I send it to Juan and it doesn't arrive — it stays waiting, on his app it doesn't show.
>
> This happens a lot, especially on high-demand days.

Bug · SKU turned off but order still arrives

Seller disables product for stockout; within ~30 minutes another order for same SKU can still come through.

Source: Store manager

Quotes:

> I turned it off and half an hour later that same product order fell again.

UX · KPIs locked to rolling 7 days — want calendar week

Current screen shows last 7 days from today, not Mon–Sun. Can't pick date range or 'today only'. Old platform allowed weekly view. Quality seal / ranking unclear — don't know weight of metrics or full peer list.

Source: Store manager

Quotes:

> Here it only gives the last seven days no matter what — I want Monday to Sunday like we used to.
>
> First in Callao of 5, second in La Perla of 4 — but we don't know which 50 stores are in the ranking.

UX · Inventory search misses formats and variants

Search by liter or brand doesn't return all variants. Turning off products is slow when combos share SKUs. Wants search that finds all products containing a parent code.

Source: Store manager

Quotes:

> You type liter and want Cristal liter — you get bottles but not what you need.
>
> If it's the same product it should turn off all related SKUs with one parent code.

Product · No stock quantity — manual count, stockouts at peak

Portfolio on/off only. Seller counts physically at night; reports low stock to supply. Customer can order 17 wines when only 3 in store. Wants VTEX-style quantity with auto-decrement and combo limits.

Source: Store manager

Quotes:

> In VTEX you put 100 on the code and the client knew they could buy up to 100.
>
> Here they can add 11 when I only have 10 packs — that generates stockouts every day.

Product · Can't add second order to courier en route

Same customer orders twice while courier is leaving — must dispatch second rider. Tuca allowed adding another order to same courier when nearby. Map doesn't show overlapping orders at same pin.

Source: Store manager

Quotes:

> The client makes another order and I have to send another courier — they could modify it to add another order.
>
> In Tuca if he was leaving and another order was close I could add it again.

Product · Seller should activate couriers — not self-activate every 30 min

Couriers go offline automatically; seller wants to activate trusted riders and assign immediately. Risk: fired/rogue courier can still accept keys if in group.

Source: Store manager

Quotes:

> Every 30 minutes it turns off — if I activate him I assign right away without waiting 1–2 minutes.
>
> A worker who stole could still take an order if I send the key — we'd rather control who's active.

Product · No seller–customer chat — deposit bottle disputes

Can't message customer in app (had it before). Courier waits at door; WhatsApp often dead. Deposit bottle confusion: customer says 'I didn't order bottles' but was charged — 1-star hits whole day.

Source: Store manager

Quotes:

> Of 50 orders maybe 4–5 have the bottles problem — in peak that's 3–4 minutes lost per case.
>
> Yesterday one star because client said they ordered Cusqueña not Stella — hurts the whole good day.

Operation · WebPO: demand + payments work; promo alert to BEES missing

Uses WebPO for weekly demand, couriers/hour, credit notes, courier payment reports. Updated Mondays. Promo in consumer app (e.g. Stella S/23) doesn't alert BEES — can't pre-stock.

Source: Store manager

Quotes:

> Promo notification reaches the customer but not BEES — if I don't have the app I don't know demand is coming.
>
> Demand section helps dimension motorcycles for Melgar vs Alianza matches.

Operation · Multi-store control: CCTV + WhatsApp, not platform

Supervisor monitors three stores on screens + group chat. Per-store managers handle ops. Platform doesn't aggregate cross-store realtime view.

Source: Store manager

Quotes:

> I have three screens, three stores, WhatsApp with all managers — if something happens in chat I check cameras.

Merino

Smallest volume of the three but strategic inventory node — neighbors route here when they turn off SKUs (+70 orders on a weekend). Katy supervises Merino + Breña POCs. OPS-heavy visit (Eduardo). 2 couriers typical, 7 on peak. 60% returnable. WebPO for demand; SLA 35 hidden in seller UI.

Bug · Map tracking stopped working reliably

Courier shows at store after delivery completed. Seller could track before; now pin doesn't move. Same as other Lima POCs.

Source: Supervisor (Katy) + OPS

Quotes:

> Sometimes the courier already delivered but it still showed him at the store.
>
> Before it worked well — now it stopped and you can't follow them.

Bug · Order notification sound intermittent

Sound works sometimes, not others. Seller busy with inventory misses orders for 1+ minutes.

Source: Store staff

Quotes:

> Sometimes it sounds, sometimes it stops sounding — you turn around and there was an order a minute ago.

UX · SLA 35 hidden; daily KPIs via WhatsApp not in platform

SLA 35 % is main metric but removed from seller screen because it was low. Supervisor waits until 9pm for previous-day indicators via WhatsApp from ops (Mon–Thu daily, Fri–Sun on Monday).

Source: Supervisor

Quotes:

> SLA doesn't appear here — we hid it because it was low, but that's what I use most.
>
> I wait until 9pm for José to send me yesterday's numbers.

UX · Inventory: combo search, character limits, portfolio gaps

Can't find combos by typing 'combos'. Product names truncated — 'cerveza Pilsen' vs 'Pilsen 630' don't match. Minimum portfolio shows combos; general inventory doesn't. ~10% of orders are combos.

Source: Store staff

Quotes:

> If you type cerveza Pilsen it doesn't detect — there goes a combo you forgot to turn off.
>
> When I close six-pack, combo should disappear too — but it doesn't always.

Product · Overlapping — consumer cancels until order hits preferred POC

App shows store name. Client at bar in front of POC cancels if order routes elsewhere — may repeat 10–16 times. Hurts Perfect Service metrics. Also motorizado loyalty: client wants specific rider/store.

Source: Supervisor

Quotes:

> The client sees which store got it and cancels until it lands at their friend's POC — 10, 12 cancellations in a row.
>
> They know the motorizado and the owner — if it goes to another POC they cancel.

Product · Pickup in store — positive, with time limits

Team open to pickup SKU (like former retail pilot). Would help capture walk-in traffic without floor sale conflict. Not after 11pm (Late Hours / municipal rules).

Source: Supervisor + OPS

Quotes:

> I don't see pickup as dangerous — consumer chooses delivery or pickup.
>
> I wouldn't offer pickup after 11pm — only until 10–11.

Product · Courier acquisition exposes store phone

Courier registration suggests a store with visible phone — sellers get midnight calls. Team hid phones in BEES admin after extortion reports. Address still visible.

Source: Supervisor

Quotes:

> They register and see the store number — the other day two called me at dawn.
>
> That should be removed — they call but never show up to work.

Operation · Neighbor POC stockout → volume spike here

When smaller POCs turn off best sellers, Merino (best inventory in zone) absorbs orders. Coverage extension to 5.7 km on weekend added ~70 orders vs prior week.

Source: OPS (Eduardo) + supervisor

Quotes:

> If the other POC runs out they turn it off and all those orders come here.
>
> Almost 70 more orders than the previous week — concentrated on weekend.

Operation · WebPO demand + payments; notifications still pilot

Weekly demand by hour, couriers needed (1.7 orders/hour target), Liga 1 matches, holidays. Payment upload replaced WhatsApp. In-app notification center for sellers not live yet.

Source: Supervisor

Quotes:

> This helps communicate promos, demand, and how many couriers we need.
>
> Notifications still don't work — managing them outside is complex.

Infra · Returnable weight — bags, 28-pack promo, stacked cartons

60% returnable. Official bag fits one carton; couriers use rubber bands for two. Fiestas Patrias 28-bottle promo hated. Seen up to 4 cartons on one moto.

Source: OPS + store

Quotes:

> The 28 promo — bottles explode, four go loose, they have to come back.
>
> I've seen one courier with four cartons — I didn't ask how.

San Pedro

Highest volume (~1,600 orders/month, 150–200 on Saturday). Dense 3.5 km zone, 7 couriers, 10am–3am. Strong SLA (95%+) but lowest TML 10 in visit. Owner in Surco shares courier pool across stores. Manual dispatch splits riders for distant simultaneous orders. Ranking stuck at #32 — algorithm opaque.

Bug · Map not real-time — en ruta filter useless

When checking order progress, courier pin stays at store. Intermittent — sometimes works. Rankings also feel stale (stuck at #32 despite improving metrics).

Source: Store manager

Quotes:

> I put the filter en ruta and it still shows the courier at the store — it never updates.
>
> We're always #32 — we don't know what we need to climb.

Bug · Order doesn't sound — missed orders on quiet shifts

On low-traffic days with few staff, multiple orders can arrive silently while seller is picking. Lost revenue.

Source: Store manager

Quotes:

> I'm alone picking — two orders came in, it didn't sound, I lost an order.

Bug · Courier name delayed when assigning

After order arrives, rider list doesn't show names for several seconds — slows dispatch on peak.

Source: Store manager

Quotes:

> I wanted to assign and the name didn't appear — it takes a few seconds every time.

Bug · Product off but order still received

Turned off SKU for stockout; same product ordered again within the hour. Happened multiple times recently.

Source: Store manager

Quotes:

> I turned it off and within half an hour the same product order came again.

UX · Search slow — no filters by format

Typing 'Pilsen' or '473' doesn't autocomplete like other platforms. Must type full 'cerveza Pilsen Callao'. No filter for can vs bottle — scrolls through 6 pages of bottles.

Source: Store manager

Quotes:

> On other platforms I type Pil and it moves — here I type Pilsen and it doesn't come out.
>
> We search for cans and get six pages of bottles only.

UX · Ranking algorithm opaque

Store consistently #32 in block; metrics improved but rank doesn't move. Wants to know formula and gap to next tier. Uses top-sellers list for replenishment, not ranking.

Source: Store manager

Quotes:

> Maybe top 3 in our block but always #32 overall — how is that determined?

Product · Stock quantity with auto-decrement requested

If 5 cases left and 2 ordered, SKU should auto-block before third order. Prevents accepting orders while picking. Aligns with La Marina / Mexico #1 ask.

Source: Store manager

Quotes:

> If I have five boxes and two orders fall, it should block automatically while we pick.

Product · In-app messaging with customer

Today: print ticket, call/WhatsApp customer from store phone. If no answer, courier tries at door. Uber-style in-app chat would save time on Saturdays.

Source: Store manager

Quotes:

> Like Uber — direct messaging with the customer would be a good option.
>
> When they don't answer we call from the store phone — that also takes time.

Operation · Manual dispatch — split riders for distant simultaneous orders

Three orders in different corners → three couriers, not one. Keeps SLA in dense grid. Owner coordinates extra riders from Surco store on projected peak.

Source: Store manager + owner

Quotes:

> One order here, one there — I send separate couriers so everything arrives on time.
>
> We review WebPO peak projection a week ahead and add 1–2 motos for Saturday promo.

Operation · BEES flex supply — 2% stockout

POCs on flex can order BEES more than once/week — critical for promos (e.g. Coronita bulk). Coordinated with RTM so orders aren't excluded. Still manual relationship.

Source: Store manager

Quotes:

> Without flex the order arrives Saturday but we're already dead by then.
>
> We're at ~2% stockout overall — flex helps a lot.

Trip synthesis

31 Aug – 3 Sep 2026 — Lima: context meeting (Aug 31) · 3 POC store visits · B2B platform (Web Tiendas) · Service level vision (Sep 1) · OYP workshop (Sep 2) · Consumer vision (Sep 3 — product roadmap + Growth pains)

Five days in Lima aligned country context, field reality, product vision, 2027 co-creation, and consumer roadmap. Peru runs 89 third-party POCs with healthy SLA (~94%) but Fill Rate flat at 92% and awareness only 9%. Store visits confirmed map/GPS, inventory, and communication gaps — same as Mexico. Web Tiendas adoption jumped 2→78 stores when payments went live (Jul 20). Sep 1 framed ecosystem comms and inventory as strategic bets. Sep 2 workshop split OPS (KPI cockpit #1), Consumer (live map #1, data/MMP #2, payments #3, wallet #4), and Rewards (Braze enrichment #1,

flash coupons, BEES admin, anti-fraud). Sep 3 Consumer vision: 12+ features on ship track but 18 Growth pains — 6 P1 gaps (returnables, search, CX bot, courier map, partial order, no-answer) plus data stack (Mixpanel↔Braze), wallet lifecycle, and 3% online pay ceiling.

- San Pedro: TML 10 at 36.8% vs 87–93% at La Marina and Merino — highest volume POC (~150–200 orders Saturday) with tight 3.5 km polygon
- Merino: stockout 4.4% with SKU availability at 68.4% — absorbs neighbor spillover when other POCs turn off SKUs (+70 orders on a weekend)
- San Pedro: seller cancellations at 12.2% — linked to inventory/combo SKU gaps and wrong-address cases
- National: Fill Rate flat at 92.3% since 2024 (target 93%) — main cancel drivers are wrong address, no answer, unmotivated consumer
- National: wrong-address cancellations ~18% (Sep 1 OPS data) — Brazil location UX candidate to copy

---

5. Ecuador

Product vision prep (Oct 7)

Ecuador runs 26 dark stores (28 in expansion plan) with strong stockout control (0.8%) but is betting a hybrid Community POC model to reach 41 cities — while product gaps (payments, sampling, courier store-switch, suggested replenishment) block tomorrow's workshop themes.

Operation is 100% dark-store today — no Community POC live yet. A national density + digitalization filter yields 41 target cities (from 6 today) and a 4-year plan for 112 Community POCs alongside the existing 28 dark stores (not a full migration). Hybrid scenario projects ~1.14M orders (+87% vs LE610k), net revenue ~16M (+50%), EBITDA ~5.3M — mainly to attack coast/competition zones (e.g. Guayaquil insecurity) where dark stores cannot open. Legal constraints require a pilot before app-based reference pricing for Community POP owners.

Portfolio is centralized: ~95% ABI supply + 5% third parties; twice-weekly templates via BEES/key-account. Stockout KPI ~0.8% (target band <2%) via supply (Cris), daily SKU-on audit, and variable incentive (~15¢/order if stockout <2%). One DDC per POC (23 POCs in promo Excel) — same granularity play as Peru; risk when scaling to hundreds of POCs. No internal inventory quantity in seller → cancellations rose after consumer-initiated cancel; team wants suggested replenishment like other delivery apps.

Courier staffing uses a weekly simulator: projected orders by hour × effective rate per motorizado per POC (garitas, distance). Shared Mondays/Tuesdays on WhatsApp; gaps closed via MotoGP gamification (rain surcharges, oil-change perks). Ecuador wants this logic automated in BEES. Supervisors run Power BI FOR with projection calculators — seller home KPI page exists but POCs do not use it.

Consumer: payment gateway blocked by past fraud trauma (card cloning, CX collapse) — cash-on-delivery still dominates. Promo engine uses step discount migration (partial portfolio), Promo Flash for liquor, regular promos Mon–Thu vs pricier Fri/Sat night. Acquisition mostly EPA paid media; lifecycle CRM with holdout tests (+50% lift Fri/Sun), hyper-personalization in Braze, mascot "T"

gamification. NPS Sep 82.21 (promoters 2668 / detractors 173); top detractor themes: times, stock, price/promos. Pain points for product: sampling broken, motorizado cannot switch POC without ticket, seller→consumer WhatsApp vs Ecuador data-protection norm (CX-mediated flow preferred).

1. Community POC & territorial expansion

Pilot finished; seeking two "real" posts. Hybrid keeps 28 dark stores and adds 112 Community POCs over 4 years — not replacing DS.

41-city filter and 112 Community POC plan — National analysis: urban % + digitalization → 41 cities (from 6). Plan adds 112 Community POCs in 4 years (22 Y1, 45 Y2, 45 Y3, consolidate Y4). Hybrid projection: 1.142M orders, GMV ~30.8B, net revenue ~16M, EBITDA ~5.3M (~1% CN EBITDA). Population coverage 42%→67%; zones 70; presence in competition-heavy coast where dark store is blocked.

> We are not looking to migrate completely from Dark Store to Community POC — a hybrid model.
>
> We would go from 610 thousand orders… to 1,142,000 orders — practically doubling.

Legal pilot and seller reference pricing — Ecuador cannot run Community POC with current app tooling — pilot offline. Need development so prospective Community POP can submit reference prices. Recruitment via BEES/FOR base (good assortment, adherence, service level). Landing page for seller acquisition (live in CO/MX) — Ecuador wants it when GO for Community POC.

> We have a legal complexity — we cannot implement the model with the tools the app gives us today.
>
> We are working a pilot… we expect an app development where the client can give reference prices.

2. Portfolio, supply & stockout

Centralized buying (Cris); twice-weekly ABI templates. Stockout among best in region; Community POC will loosen supply control.

Centralized assortment — 95% ABI — Christian Chávez owns supply. Dark stores do not access BEES for ordering — key-account templates, DINADEC delivery, credit (no cash on delivery). Third parties monthly. Portfolio refresh every 3 months; commercial changes tracked to avoid dead inventory.

> 95% of purchase is to the core brewery and 5% through third-party suppliers.
>
> We define what arrives, what does not, how much and how often — all through BEES.

Stockout 0.8% — incentive + audit — KPI ~0.8% (historically ~1.5%). Levers: supply responsiveness to events, daily person checking physical inventory vs SKUs on, monetary incentive to POC if stockout <2% (~15 cents/order). Reactive layers sit on top of proactive supply.

> We currently have a fairly good stockout indicator — 0.8%.
>
> If they stay below 2% stockout they get an incentive in the ASM part — about 15 cents per order.

One DDC per POC — promo granularity — Moved from one DDC per 5–6 POCs to one DDC per store — improved indicators. Promo Excel lists 23 POCs with minimum portfolio each. At 500 POCs, may regroup by zone when behavior converges. Community POC owners will order themselves —

suggested replenishment needed.

> From each POC that is created, a DDC is created.
>
> I have an Excel with the detail of the 23 POCs — minimum portfolio per POC.

3. Couriers, MotoGP & forecasting

Weekly motorizado need by hour per POC from simulator; rain and World Cup reactivation via MotoGP.

Hourly motorizado simulator (manual → BEES) — Forecast weekly orders (e.g. 4k Sat/Sun), convert to motorizados/hour using effective delivery rate per POC (garitas → 1 order/hr; dense zones → 3). Share plan Mon/Tue on ops WhatsApp. Gaps vs actual trigger gamification pushes. Team wants raw BEES export (delivery time, cancel flag, hour) automated.

> We share a need for motorizados per hour... it feeds from a simulator.
>
> If it could be automated on the BEES platform we would gain a lot.

MotoGP — training, points, gift cards — Gamification platform: monthly training (+25 pts), order rating ≥4.95 (+10), SLA35 ≥97% (+10), accuracy ≥98% (+10). Penalties for rating ≤2 (lose 30 pts/day). Anniversary triple-points events. Redeem gift cards (sent to POC email). Used for rain franja bonuses and reactivation of Jun/Jul World Cup motorizado base.

> We have a gamification platform with motorizados — MotoGP.
>
> Today we activated three initiatives by time slot — extra pay for rain.

Supervisor Power BI FOR — not seller home — Daily KPIs to POCs: orders, cancel, fulfillment, MLA accuracy, NPS, Perfect Order, cold rate. Projection calculator for incentive math (rule of three on monthly orders). Seller ranking exists in app (7-day zone) but POCs rely on supervisor dashboard.

> We send indicators every morning... a Power BI dashboard.
>
> They have a view in seller, but this is focused on the indicators that are their monthly goals.

4. Product roadmap (Service Level)

Canelas/Vivian presented seller batch accept, map, auto-dispatch, KPI wall, fleet manager, reimbursement screen, comms hub — Ecuador asked for daily incentive visibility.

Seller peak features shipped in region — Order summary batching, accept-all, live motorizado map, auto-distribution to couriers, devoluciones roadmap, weekly payment availability per courier. KPI competition between stores. Fleet manager admin for couriers.

> Accept all orders — very important in peak hours.
>
> Map visualization of motorizados — significant reduction in servir and fleet recomposition.

Four pillars: territory, inventory, orders, fleet — 2027 sequencing: heavy fleet work done; shifting to orders pillar then inventory (stockout + fill rate). AI micro-insights for supervisors. Reimbursement weekly extract per POC — Ecuador wants daily incentive visibility like test in other countries.

> We have four pillars — territory, inventory, orders and fleet.
>
> Daily visibility of incentives would be super good for Ecuador.

Ecosystem communication (in progress) — Chat between consumer, seller, courier — reduce friction, improve conversion; launch end of month with impact measurement. Comms hub for sellers (features, NPS, surveys).

> We want communication between consumer, deliverer, seller and intersex — less friction.

5. Ecuador pain points → Oct 8 workshop

Courier POC migration, WhatsApp legal, payments, sampling.

Motorizado cannot switch POC without ticket — After Vitex migration, one motorizado = one POC (legal/third-party). Closed store or weekend city change requires back-office removal + re-register. Product: allow move (not parallel work) with legal review — Cindy to put on workshop board.

> A motorizado registered in Quito cannot work in Calderón — user tied to the first POC.
>
> We had to lift a ticket to request store change or delete the user.

Seller direct WhatsApp vs data protection — New feature sends consumer message from seller WhatsApp. Ecuador legal: seller should not contact consumer directly — flow via seller questions → CX ticket works well (high seller–CX contact).

> In theory SL should not communicate directly with the client — protection of data.
>
> Seller uses seller view → CX raises ticket → CX talks to client.

6. Consumer — payments, promos, acquisition

Gateway blocked by fraud history; rich CRM and promo calendar; EPA acquisition.

Payment gateway — fraud trauma — Top consumer pain. Technically available but activation blocked after past card cloning, bank make-good costs, bad UX, CX collapse. Cash on delivery still works; users expect digital payment option.

> Payment gateway is something super pending.
>
> We had to replace a lot of money to the bank and users — card cloning, identity theft.

Promo planning — Kiss Moments + agile CRM — Revenue/price list from core; Tue/Wed planning with Cindy. Calendar: Oktoberfest, Black Friday, icons by occasion. Step discount migration by brand/format (not full portfolio — user education). Promo Flash ~1 month, strong for liquor. Fri/Sat 21:00+ pricier step/addon SKUs. Sampling configured but feature not working — reported to Luis.

> Planning every Tuesday and Wednesday — how last week went and next week actions.
>
> Promo Flash works very well for liquor.

Acquisition EPA + lifecycle — Majority acquisition via EPA (paid media). Lifecycle: at-risk/churn segments, wallet coupons, push/mail, mascot T gamification. Weekly campaign performance cross with Braze; holdout tests show +40–50% lift in prime slots; mornings neutral.

> The largest part of acquisition we do from EPA — paid media.
>
> Friday 18h +50% real lift — one in three purchases created by the push.

NPS ecosystem Sep — Consumer NPS 82.21 Sep (down from spring highs). Detractors: times (12), price/promos (8), stock (4), app/account (6). Seller NPS 96.67 YTD; courier 89.23. Pauli to share monthly NPS action deck per POC on Teams.

> We analyze NPS every day.
>
> Share monthly analysis of actionables — helps Consumer Voice.

Prep pains for Oct 8 workshop

[Critical] Payment gateway blocked after fraud history — Digital payments expected; activation stalled due to past card cloning, chargebacks and CX overload. Blocks parity with competitors and digital-first positioning.

Product: Risk-controlled rollout + monitoring — not permanent off switch.

[Critical] Community POC pilot — legal + app pricing workflow — Cannot scale Community POP with current app; need reference-price flow and seller landing when GO. Hybrid model is strategic for coast/insecurity.

[High] No suggested stock / quantity — cancellations up — Without seller inventory quantity, consumer cancel flow increased cancels. Community POC will worsen without replenishment suggestions.

Product: Same as Peru/MX inventory quantity MVP.

[High] Sampling mechanic not working — CRM loaded sampling campaigns but feature failed in production — blocks liquor/snack trials.

[High] Motorizado locked to first POC — Store closure or city move requires ticket + user delete. Vitex-era legal rule; ops needs fast transfer (not multi-store).

[High] Motorizado forecast manual — automate in BEES — Weekly Excel/simulator + WhatsApp; logic is deterministic from BEES raw data.

Product: Peru WebPO-style demand heatmap + EC hourly model.

[Medium] Step discount — partial portfolio + user confusion — Gradual migration by brand/format; CEPS feedback that mechanics confuse some users despite good price perception.

[Medium] Direct seller→consumer WhatsApp vs Ecuador data law — New product sends from seller WhatsApp; Ecuador prefers seller→CX→consumer ticket flow that already performs well.

[Medium] POC incentive / reimbursement daily visibility — Variable-heavy model; weekly summary insufficient vs fixed+variable mix Ecuador runs.

[Medium] Flash promo strict on/off windows (e.g. 3x2 until 12:00) — W41 calendar requires ops to switch flash combos at opening and OFF at noon — product/offers tooling must support reliable scheduling.

Ecuador cross-themes (prep)

Hybrid expansion — Dark store control + Community POC density for coast/competition — 6→41 cities.

Granular DDC per POC — Promo/portfolio Excel at 23 POCs — converges with MX/PE DDC pain at scale.

CRM discipline — Holdout incrementality + hyper-personalization — model for other markets.

Ops-built dashboards — Power BI FOR when product seller home unused — same pattern as PE WebPO.

OYP workshop (Oct 8)

Ecuador's Oct 8 workshop converges on inventory truth, payments trust, and courier economics — with Club TaDa integration and POC tooling as the top voted near-term bets.

Operations dominated the pain board: stock shows as zero or infinite, POCs lack live quantity and post-BEES migration removed the old Vitex daily load workflow. Supervisors want a theoretical opening stock fed by sales, Excel export for cash close, and less manual copy of order codes. Admin (Luis) pushed dynamic delivery fees by distance band, rain surcharges, tips, and service fee — Ecuador charges a flat ~$1.500 whether the ride is 5 or 30 minutes.

Consumer pain reinforced why the gateway stays off: cards were reused without OTP/Face ID, fraud spiked, and banks forced refunds. Until risk-controlled online pay exists, cancel-after-dispatch penalties cannot stick. First-order NPS suffers because users cannot edit phone, address, or email without tickets or account deletion; map layers under-resolve landmarks (e.g. malls), driving wrong pins and cancels.

Rewards/CRM: Club TaDa external platform is painful — integration by year-end is the top vote (4). Sampling CSV loads fail in Ecuador despite working elsewhere. Promo mechanics force duplicate SKUs for color variants, bloating the app. Dreams point to ERP/SAP-grade inventory, BizWam supervisor dashboards, split pay ("Círculos"), subscriptions, and cross-country dark-store competitions.

Workshop insights

[Critical] Live inventory quantity — zero/infinite stock and peak sell-through — POCs want to enter units per SKU (Vitex-style) with auto decrement and auto-off at zero. Today Pareto rules (e.g. off at 4 units) are manual; peak dispatch can leave SKUs 'on' and drive cancellations.

Votes: 2

[Critical] Club TaDa native integration — External loyalty stack makes CX painful; team migrating integration — workshop's #1 voted item.

Votes: 4

[Critical] Online payments off — fraud trauma blocks cancel fees & personalization — COD dominates; card only at door. Stored cards without step-up auth led to cloning and bank chargebacks. Cancel penalties and dynamic fees need card on file.

[High] Consumer cancel after dispatch — couriers paid only per delivery — EC pays couriers per completed order, not per attempt. User-initiated cancel after rider is en route hurts NPS; team wants fee + messaging once POC assigns rider.

[High] Cannot edit account data — first-order cancel spike — Wrong phone/address/email on first order; fix path is ticket or delete account. Critical before Dec peak when they manually clean bases.

Votes: 2

[High] Map layers & weak geo suggestion — Secondary-street layer may be too coarse; mall names resolve to wrong cities. Quick 'yes' on distant-location warning locks bad pins.

Votes: 2

[High] Sampling not working in Ecuador — Feature active in other countries; CSV attempts (10k rows, price variants) never surfaced free gift SKUs — tickets with Luis pending.

[High] Admin CSV → in-app rules (delivery bands, rain, tips, service fee) — Delivery fee flat regardless of distance; no service fee; rain surge manual. Luis wants POC-to-POC fee grids without CSV errors.

[Medium] POC order list export for cash close — POCs copy order codes one-by-one into Excel for SKU, courier, payment method — want downloadable report.

[Medium] Variant promos — 7–8 SKUs for one bundle (color choice) — No variant picker under one SKU; app weight hurts discovery. Step discount helped but catalog still heavy.

[Medium] POC tools — assign orders & sectorized courier routing — Wish for intelligent assignment by order geography; related to supervisor live dashboard in BizWam.

Votes: 2

[Medium] Consumer ↔ courier messaging — Voted challenge; ties to wrong address/contact and cancel reduction.

Votes: 2

[Medium] Live promo counters (e.g. first 100 orders) — EC runs split campaigns (order #100, #1000); needs in-app progress like promo deadline UI.

Votes: 2

Vote winners — challenges

- Club TaDa integrated (4)
- POC assign-order recommendations (2)
- POC stock quantity per SKU (2)
- Remind user: not at delivery address (2)
- Consumer ↔ courier message (2)
- User can update profile anytime (2)
- Live visual for promo counters (2)
- Auto-configured free gift products (2)

Vote winners — dreams

- Monthly subscription / TaDa premium (4)
- ERP (SAP) + reliable inventory MB (3)
- AI dynamic geofences (km + demand) (3)
- Automated inventory reconciliation (3)
- Split / group pay in app (Círculos) (3)
- Full seller health in BizWam (3)
- Repeat last order (3)
- Scheduled delivery & event bundles (3)

Dream backlog

Operations · SAP / Dynamics ERP integration — Trustworthy MB, automated conciliation, theoretical live stock per dark store.

Operations · Supervisor command center in BizWam — Delayed orders, cancelations, alerts by city — especially match days and peaks.

Operations · AI geofence + motorizado staffing alerts — Flag geofences exceeding km radius; predict 6–8pm demand vs couriers on hand.

Consumer · Group pay & wallet cashback — Banco Guayaquil 'Círculos'-style split bill; points convert to wallet dollars.

Consumer · Events & multi-vertical basket — Sell beer for festivals in-app; McDonald's + beer one courier without breaking SLA metrics.

Consumer · International app store listing — Expats (e.g. leadership on BR App Store) can install EC TaDa while traveling.

Rewards · Subscription tiers + scheduled delivery — Cinema-style plans; program delivery for match time without hurting POC SLA.

Rewards · Braze gamification — sustainability & Tadi — Monthly challenges, zone rankings, returnable bottles / low-alcohol goals.

Hospitality (telão)

Consumer — Birthday order free or surprise gift without ordering. Birthdays are multi-day social occasions in Ecuador.

Consumer — Meet your favorite football player via sponsor partnerships. CN has strong club deals — mirror Zé Delivery stadium experiences.

POC / Courier — Welcome kit for new stores; top courier / top store recognition cross-country. Brazil 'top 200 couriers' coupon became city-wide pride moment.

POC — Dark-store World Cup across countries. EC internal mundialito empowered stores; scale to LATAM.

Workshop cross-themes

Manual Excel is the hidden OS — Stock rules, courier forecast, admin fees, cash close, and promo splits all still live in spreadsheets and CSV.

Payments unlock second-order fixes — Cancel fees, penalties, wallet, and split pay all depend on trustworthy online rails.

First order = trust moment — Profile edit, address confirm, and sampling/Club integration show up together in NPS stories.

Hospitalidad as differentiation — Team wants emotional peaks (birthday, football, recognition) beyond transaction efficiency.

---

6. Colombia

1YP TaDa — Product introduction — 13/09/2026

Day 1 of Colombia OYP week — Colombia shares 2026 performance, growth/commercial/ops plans; Brazil previews deeper ops/consumer/rewards sessions (Sep 13 PM + Sep 14 AM).

Colombia is growing 50–60% YoY with acquisition sometimes above Mexico — but marketplace and bank promos changed the user mix, retention is under pressure, and own-store vs Community POC (aliado) models need different product hooks.

Growth shifted budget earlier in the year and diversified beyond paid media into bank partnerships (10–15% of users at ~$2–3 CAC; blended ~$5–6). World Cup and football promos spiked acquisition (~22–24k) but hurt retention when promos ended. ~30% of beer-paid acquisition still buys marketplace-only baskets — marketplace users buy every 22–30 days vs 12–14 for beer-only, shop more at night, and cluster into low-AOV (<50k COP) or high-AOV (>120k) bands that retain poorly.

Commercial + ops built an availability score when BEES and store ERP (SIESA) are not integrated — penalize stores that have stock but keep SKUs off in BEES. That lifted onboarding/conversion and marketplace attach. Stockout is managed in Power BI (category view today); allies face stricter 90%+ rules as order volume grows. Product ask: SKU-level stockout in platform, not category rollup only.

Colombia is the most own-store-heavy market (~69 own vs ~120 Community POC; still ~80% orders on own stores, ~20% allies). Paypoints, data access (Power BI, clusters), and owner change differ from aliados — Top Tiendas bridges allies; Luana's team pressures underperforming pockets. Expansion: more overlap when a store turns off (not full auto-spillover), Torre de Control (2 people weekends) + WhatsApp alerts for unique-zone stores. Plan to ~double Community POC next year while tightening peak coverage on own stores.

Rewards: Club TaDa under-resourced (key people left/ injured); Lovers base and frequency down; missions postponed. Tiers segment beer vs marketplace journeys. Product wants algorithmic For You shelves (not one manual showcase for all); SEM vs sampling constraints for rotating hero SKUs (e.g. thermal bag). ERP/e-invoicing compliance drives priority API for billing + downloadable order lines — Zé Delivery lesson: integrations without seller product adoption fail.

[Critical] BEES off while store has stock — SIESA not integrated — False availability (liquid vs bottle, SKU off in BEES) hurt first orders. Colombia invented an availability score + ranking + incentive — same class of pain as quantity MVP in MX/PE/EC.

Global rank #44

[Critical] Marketplace acquisition dilutes retention — new clusters & night behavior — ~30% of beer campaigns land marketplace-only carts. Users buy every 22–30 days vs 12–14 for beer; poor retention when AOV <50k or >120k COP. CRM timing must differ.

Global rank #45

[High] Bank partnerships — efficient CAC, weak post-promo retention — 10–15% users at $2–3 CAC; BIN/datáfono reporting proves value to banks. Big bank 50% promo spiked users then churned when turned off. 2026: partnerships for retention (points), in-app bank story missing.

Global rank #46

[High] Own stores vs Community POC — 80/20 orders, different paypoints & data — Most orders still own stores; allies lack Power BI/cluster access — Top Tiendas + Luana bridge. Paypoints and owner swap differ from EC Community POC / PE third-party model.

Global rank #47

[High] Store-off coverage, overlap & Torre de Control — Cannot auto-cover full polygon when aliado off; need thoughtful overlap (3–4 stores/zone). Weekend Torre de Control + WhatsApp red alerts for unique-zone offs — same pain as MX spillover rank #4.

Global rank #48

[High] Stockout in platform — SKU line at 90%, not category only — Power BI category stockout works for allies ramp; extended SKU portfolio tool external. Ask: BEES/seller shows per-SKU stockout bar like commercial minimum threshold.

Global rank #49

[High] Club TaDa capacity gap + algorithmic For You shelves — Club team understaffed; Lovers down; missions delayed. Product vision: algorithmic For You; blocked by SEM single-SKU layout vs sampling flexibility.

Global rank #50

[High] E-invoicing — order export / billing API (Zé Delivery lesson) — After accept, order data hard to bill; manual discounts; control audit pressure. Prefer one documented API over 40 ERP integrations if sellers adopt — else features never reach aliado stores.

Global rank #51

[Medium] Flash promo slots & marketplace occasions — Flash promo runs all day in slots (beer midday, marketplace night). Next year: occasion-based cross-sell personalized by day/hour.

[Medium] CIESA / ERP path for high-volume allies — High-volume Community POC (~2k orders/mo) could integrate if ERP option exists; e-invoicing mandatory — availability pass-through helps allies even if not full CIESA.

Two-speed retail model — Own stores (control, SIESA, 80% orders) vs Community POC (capillarity, data-poor) — product cannot ship one seller playbook.

Acquisition composition vs retention — Partnerships + marketplace + football promos change who enters — tiers and CRM must follow, not one beer journey.

Availability before personalization — BEES/ERP gap and SKU stockout visibility precede For You and occasion cross-sell bets.

Integrations need adoption — Billing API only wins if stores keep using seller — Zé parallel warns against ERP-only roadmaps.

---

7. Puebla Project

Puebla Project — Field + CX rotation · 2026

CX retention & proactive WhatsApp, store visits (Cholula, Buenavista, Radial, Periférico), Turbo rollout, and parallel-email / Contáctanos enablement — transcripts from Puebla project folder.

Puebla in one line: the promise breaks in the handoff — among CX, store, courier, and consumer — and product still does not close the loop on response, stock, delivery, and trust.

The Puebla Project bundles nine field conversations (plus one duplicate proactive CX file in the source folder): three rotations with the Puebla CX team and six store or mixed sessions in the region (Cholula, Buenavista/Buena Vista, Radial, Periférico), plus a ticket-review session during a visit to Aguascalientes. The through-line is not “lack of local effort” — it is systemic friction between what the consumer sees in the app, what the store can run, and what CX can resolve on time.

On the CX side (Retention), work is ticket by ticket: Club TaDa point refunds after expired orders (~24h escalation to Briseida/Club while the consumer waits up to ~2 days), coupons that read like free beer (Club Corona), modeloramas that refuse redemption, static delivery codes that allow “delivered” without handoff, stale courier map pins, and financial cases (double charge) stuck for weeks because the POC never answers parallel email. Explicit ask: auto-return points when an order expires.

Proactive CX (WhatsApp) shows the recovery upside: after delay, unexplained cancellation, warm beer, or silent brand swap (Corona for Victoria), agents win users back when 250 points land in 10–15 minutes — but they hit WhatsApp spam limits (~50 messages/day), generic macros that feel accusatory (“your situation”), and a dashboard that shows zero TaDa points after grants. Personalization and fixed reporting are prerequisites to scale the channel.

In stores, Cholula confirms ops improved with more couriers and weekend floor help, but platform fragility remains: tablet alarms fail (orders expire), laptops work better; BEES shows the store “off” for supervisors while the POC is open until refresh; local turbo hits ~6–11 minutes but the 35-minute metric should stop at “llegué”; batched orders stretch the second order’s SLA. The second Cholula visit trains Contáctanos (live ticket #84), but the description does not appear in the CX agent view — and parallel email still hides cases from staff on the floor.

Buenavista/Buena Vista and Radial/Periférico expose last mile and Turbo rollout: 1 km geofence, ghost turbo polygon in SM, new-user badge dropped on turbo orders, broken coverage export, turbo vs normal sequence ignored in the courier app, map showing the rider still at the store mid-route. Buena Vista adds geography — up to 6–7 gated clusters per trip, 25+ minutes transit — making a 35-minute SLA unrealistic. Periférico crosses the 30 kg order cap with 25 kg bags, misconfigured promo SKUs (24 kg), megas that do not fit, and a clear need for rider–consumer messaging.

Radial reinforces the communication bottleneck: CX sends parallel-email requests and needs a ~30-minute answer while the consumer is on the line; inbox split between OSI and an entrepreneur running three POCs; stores prefer to fix at the counter. Across all axes, eight cross-themes align: POC non-

response, order integrity (short ship, swap, fake delivered), payments/change, BEES reliability, bag/weight capacity, promo/Club clarity, proactive WhatsApp design, and Turbo + tracking alignment.

- CX: Less manual Club TaDa escalation; auto-refund on expiration; parallel mail with supervisor CC and store SLA; proactive WhatsApp with personalization and correct metrics.
- Stores: Reliable alert sound and refresh on any device; synced on/off status; Contáctanos as official channel (fix CX view); less ad hoc WhatsApp.
- Delivery: Align bag/weight/promo rules; live map; chat or messaging; metric at 'llegué'; clear turbo UI for store and courier.
- Trust: Communicate swaps and cancellations; dynamic codes; temperature and order completeness — where NPS drops even when delay is "acceptable".
- Transcripts: 9
- CX sessions: 3
- Store / mixed: 6
- Cross-themes: 8

Visit map

CX · Retention (Rota CX) — Club TaDa backlog, coupons, static codes, tickets 6–60 days without POC reply.

CX · Proactive — Post-friction WhatsApp, fast points, spam limits, silent swaps and warm beer.

CX · Field (Rota CX 2) — Double charge, large short-ships, Abasto Pasa silence, Alejandra escalation path.

Cholula — Tablet vs laptop, BEES desync, turbo, Victoria stockout, Contáctanos training.

Buenavista / Buena Vista — Turbo 1 km, new-user UI, private clusters, alerts and multi-tab orders.

Radial / Periférico — Parallel email, fleet/rain gear, 30 kg bags, map and turbo order rules.

Cross-themes

[Critical] Store non-response & slow parallel-email loop — CX waits days to months when POCs ignore parallel threads; supervisors often not CC'd; financial and large short-ship cases stall while users churn.

Evidence: Rota_CX.txt, Rota_CX_2.txt, Cholulacereso_2.txt, Radial.txt

> no tenemos respuesta del punto de venta
>
> Abasto se llama y no contestaron nunca

[Critical] Fulfillment integrity — short ship, wrong SKU, fake delivered — Peaks amplify incomplete orders and silent substitutions; static delivery codes enable 'entregado' without handoff.

Evidence: Rota_CX.txt, Rota_CX_Proactive.txt, Perife_rico.txt

> casi siempre mandan menos
>
> los repartidores ya saben tu código

[Critical] Payments — double charge & cash change disputes — Terminal issues cause duplicate charges; change theft by riders; resolution waits on store with inadequate coupon caps.

Evidence: Rota_CX.txt, Rota_CX_2.txt, Rota_CX_Proactive.txt

> le cobraron dos veces con la tarjeta
>
> nunca regresó al repartidor

[High] BEES reliability — alerts, refresh, on/off desync — Missed tablet alarms, silent notifications with floor music, desynced store status, multi-tab refresh → expired orders.

Evidence: Cholulacereso.txt, Buena_vista.txt, Buenavista.txt

> con tablet la operación es peor
>
> a mí me aparece apagada

[High] Last-mile capacity — mochilas, weight, promo SKUs — 30 kg cap vs bag limits, fragile bags, mega repacking, mis-set promo weights force dual-rider hacks.

Evidence: Perife_rico.txt, Cholulacereso.txt

> limitación de 30 kilogramos
>
> mandemos dos repartidores

[High] Promotions, coupons & Club loyalty clarity — Coupon wording, modelorama refusal, points refund not visible in app → 'estafa' perception; auto-refund on expire desired.

Evidence: Rota_CX.txt, Rota_CX_Proactive.txt

> Me dicen mira es una estafa
>
> a ellos no les aparece de inmediato el reembolso

[High] Proactive CX — WhatsApp limits & reporting — Spam blocks cap ~50 msgs/day; rigid macros; dashboard shows zero Tada points despite grants.

Evidence: Rota_CX_Proactive.txt

> WhatsApp te lo teta como spam
>
> los puntos TADA no nos da resultados, siempre aparecen ceros

[Medium] Turbo rollout, tracking UX & seller tooling — 1 km geofence, polygon export gaps, turbo/new-user UI bugs, grouping priority, SLA at 'llegué' alignment.

Evidence: Buenavista.txt, Perife_rico.txt, Cholulacereso.txt, Radial.txt

> solo un kilómetro a la redonda
>
> cuando llega un Turbo ya no aparece

Sessions (interviews)

CX · Retention rotation

Retention-focused CX walks live backlog: Club TaDa point refunds, modelorama non-response, coupon confusion, static delivery codes, and winner verification blocked by VPN. Weekend expired orders spike; agents want automatic point return on expiration.

Operation · Club Tada refund escalation latency

Weekend expired orders need Club Tada (~24h); CX promises ~2-day follow-up.

Quotes:

> Club Tada sí se tarda aproximadamente 24 horas
>
> los fines de semana sí tienden a expirarse bastante

Bug · Refunded points not visible

Users told points returned but balance does not update after refresh.

Quotes:

> a ellos no les aparece de inmediato el reembolso

Product · Auto-refund on expiration

Instant point return when order expires would remove manual flow.

Quotes:

> si estaría padre que ya se reembolsarán por automático

Operation · POC / modelorama silence

High-value cases stall 6–60 days without parallel response.

Quotes:

> Este ticket ya tiene 6 días y todavía no solucionamos

UX · Club Corona coupon semantics

Users expect free beer; minimum purchase hidden in consumer app.

Quotes:

> ellos piensan que le va a llegar gratis

Operation · Static delivery confirmation codes

Riders memorize codes; orders marked delivered without handoff.

Quotes:

> el código para de entregar no es dinámico, siempre es el mismo

UX · Map tracking drives tickets

Rider pin stale though order en route.

Quotes:

> no tienen como la visibilidad del repartidor en el mapa

Operation · Temp CX account activation

Puebla temps need monthly reactivation or cannot work.

Quotes:

> las cuentas hay que pedir que les activen las cuentas cada mes

CX · Proactive WhatsApp

Proactive WhatsApp after operational friction: delays, silent cancellations, warm beer, SKU substitution. ~50 msgs/day limit; personalization reduces spam blocks. Fast 250-point grants rebuild trust; reporting dashboard shows zero points.

Operation · Cancellations without narrative

Stock-out cancels without explaining why to consumer.

Quotes:

> si me cancelaste pero por qué me cancelaste

Operation · Silent SKU substitution

Corona vs Victoria without notice — top complaint.

Quotes:

> me llevaron Corona en vez de Victoria y no me avisaron

Operation · Warm product delivery

Hot beer frequent; cold-chain/ice capacity.

Quotes:

> producto fuera de temperatura que llega caliente

CX · WhatsApp spam throttling

Identical bulk messages trigger 24h blocks.

Quotes:

> WhatsApp te lo teta como spam

Product · Fast points crediting

10–15 min point grant increases repurchase.

Quotes:

> en diez, quince minutos... ya se ve reflejado

Operation · POC repeat-failure visibility

Want tickets tagged by POC; deactivated store still took orders.

Quotes:

> el punto estaba desactivada desde hace dos semanas

Product · Reporting dashboard points = 0

Recovery coupons count; Tada points column broken.

Quotes:

> los puntos TADA no nos da resultados, siempre aparecen ceros

CX · 3-hour closure vs late replies

Users answering next day fall out of proactive base.

Quotes:

> me contestan ya al día siguiente

CX · Field ticket review

CX leadership reviews aged financial tickets at a seller visit: double charges, large short-ships, Monterrey skew. Puebla escalations via Alejandra; supervisors rarely CC'd on parallel mail.

Operation · Double charge backlog

Users churn after last purchase on bad payment experience.

Quotes:

> le cobraron 400 y el pedido era por 218

Operation · Puebla escalation via Alejandra

Email supervisor with Luis Galindo CC.

Quotes:

> Mándale correo a Alejandra con copia a Luis Galindo

Operation · Supervisor not on parallel mail

Practice gap vs stated process.

Quotes:

> Normalmente ellos copian el supervisor?
>
> No, no hemos copiado

Operation · Short-ship coupon limits

100 peso max inadequate for large beer misses.

Quotes:

> compró 21 y le faltaron 10
>
> cupón mayor es el de 100 pesos

Operation · High KPI POC still silent

Abasto Pasa never answered 27-day case.

Quotes:

> Abasto se llama y no contestaron nunca

CX · Sleeper user tolerance

58-order user returned; first-timers would not.

Quotes:

> usuario que ya hizo 58 órdenes

Cholula · Operations

Cholula store improved with more riders and weekend floor help; tablet alarms failed until laptop. BEES shows off while store on until refresh. Turbo ~6–11 min locally; portfolio gaps on Victoria media/Familiar.

Infra · Tablet order alarm unreliable

Silent tablets → expired orders; laptop better.

Quotes:

> con tablet la operación es peor

Bug · BEES on/off desync

Supervisor sees off; seller photo shows on until refresh.

Quotes:

> a mí me aparece apagada, pero ellos me mandan... está encendido

Operation · Weekend staffing fix

Second rider + in-store help on peaks.

Quotes:

> el reparto que nos hacía falta

Operation · SKU desabasto in app

Victoria media/Familiar unavailable despite demand.

Quotes:

> victoria media y está en desabasto

Product · Turbo local success

~6–11 min deliveries; traffic limits 15-min promise.

Quotes:

> eran seis minutos

Operation · Grouped orders extend SLA

Second order timer runs during first stop.

Quotes:

> si llevas un agrupado se tarda mucho

UX · Consumer tracking lag

User thinks rider still at store.

Quotes:

> me aparecía que todavía no salías

Operation · Delivery metric at llegué

35-min metric should stop at arrived tap.

Quotes:

> hasta que tú le indicas llegué

Cholula · CX enablement

CX trains store on response SLAs and Contáctanos ticketing vs WhatsApp-only. Live ticket #84 works; description missing in agent view. Help articles stale; riders cannot open CX tickets from courier app.

CX · Consumer response time

Delayed store loop → no repurchase.

Quotes:

> en siete días el consumidor dice yo pedí para la semana pasada

Operation · Parallel email unnoticed

CX cases in inbox sellers never opened.

Quotes:

> el cliente pidió a gritos auxilio

Product · Contáctanos ticket flow

Store opens CX tickets from seller app.

Quotes:

> me pone el asunto... lo envía
>
> Es el 84

Bug · Ticket description missing in CX

Agent ack without user-submitted body.

Quotes:

> pusiste la descripción y no sale acá

UX · Stale help articles

2025 training not in FAQ hub.

Quotes:

> Pero está viejito esto

Product · No in-store QR on materials

Flyers lack app download QR.

Quotes:

> ningún trae QR

Product · No CX ticket from rider app

Riders must ask seller; chat restricted.

Quotes:

> En la aplicación del repartidor no tenemos cómo abrir una comunicación con CX

Operation · Rain protocol unused

Formal protocol exists; per-order coordination norm.

Quotes:

> Protocolo de lluvia. Nunca le damos foro a eso

Buenavista · Turbo rollout

Ops/product review Turbo: 1 km geofence, ghosted turbo coverage in SM, new-user badge hidden on turbo orders, metric should cut at 'llegué', polygon export missing.

Product · Turbo geofence 1 km

Hard radius; manual Maps polygons for analysis.

Quotes:

> Turbo viene solo un kilómetro a la redonda

Bug · New user label on turbo

Turbo badge may replace 'nuevo' in seller/rider UI.

Quotes:

> cuando llega un Turbo ya no aparece... usuario nuevo

Product · Weak turbo visibility for riders

Subtle yellow marker.

Quotes:

> El repartidor no tiene forma de saber

Operation · Turbo SLA at llegué

Align metric with standard delivery.

Quotes:

> Cuando da llegué

Product · Turbo coverage ghosted in SM

Only normal polygon editable.

Quotes:

> El turbo aparece como si fuese una sombra

Infra · No polygon export

Reporting lacks coverage header.

Quotes:

> cuando yo lo extraigo no viene la cabeza

Buena Vista · Zone ops

Buena Vista: 6–7 security cluster stops per trip, 25+ min transit — 35-min SLA unrealistic. Alert failures with floor music; multi-tab order UI; usually one order per rider.

Operation · Gated cluster delays

Queues at private security multiply ETA.

Quotes:

> puede pasar hasta seis, siete clústeres

Operation · SLA unrealistic for zone

25 min transit + filters exceeds promise.

Quotes:

> 35 minutos pues las son reales

Infra · Silent order alerts

Music on floor; missed until refresh → expired.

Quotes:

> tres expirados

UX · Multi-window orders

Auto-refresh disrupts active tabs.

Quotes:

> son muchas páginas las que se abren para un solo pedido

Operation · Single-order dispatch norm

Typically one order per trip.

Quotes:

> Solamente una

Operation · Coverage constrained by river

Cannot expand polygon simply.

Quotes:

> Estamos por un río

Radial · CX parallel mail

CX confirms parallel-email workflow at Radial modelorama. Email fragmented across OSI and entrepreneur with three POCs. Slow replies vs 30-min consumer window; in-person app education helps conversion.

Operation · Email ownership fragmented

Three Tada POCs share mail flow.

Quotes:

> Los tres tienen taba y el correo donde llega la información

Operation · Slow parallel response

Hurts consumer SLA when mid-delivery.

Quotes:

> tenemos 30 minutos para resolver

UX · Unclear seller→CX path

Staff unsure how to reach support.

Quotes:

> La verdad no. Dónde están los pedidos

Operation · In-person app education

Walk-ins steered to app with price compare.

Quotes:

> métete a la aplicación

Operation · Fleet rain readiness

Boots, phone covers reduce delays.

Quotes:

> no tienen las botas

Product · Turbo operational load

Turbo libre fills tacono.

Quotes:

> acá tiene el turbo, turbo de libre

Periférico · Last mile

Periférico last-mile: 30 kg order cap vs 25 kg bags, promo SKU allowing 24 kg, mega repacking, stale customer map, turbo grouping not enforced, no rider-consumer chat.

Product · Promo SKU weight misconfiguration

4-mega promo → 24 kg orders; two-rider workaround.

Quotes:

> les dejaba pedir hasta 24 k

Infra · Backpack vs order limit

30 kg orders; 30 kg bags not received.

Quotes:

> limitación de 30 kilogramos por orden

Operation · Mega repackaging

Megas don't fit bags; repack to Modelo boxes.

Quotes:

> no cabe la Mega

UX · Stale customer map

Tracker shows at store during delivery.

Quotes:

> al cliente le aparece que él sigue en la tienda

Product · Turbo grouping not enforced

Normal before turbo allowed.

Quotes:

> entregar primero el normal y después el turbo

Operation · Metric cut at llegué

Timer should stop at arrived.

Quotes:

> hasta exactamente hasta que tú le indicas llegué

UX · No rider messaging

Want in-app chat for change/ETA.

Quotes:

> estaría bien... un tema de mensajes

CX · Rudeness under stress

Code waits + map + time pressure.

Quotes:

> los compartidores por eso son un poco groseros

---

8. Research (Pesquisas)

Research — TaDa Delivery

Apr–Sep 2026 · updated Sep 2026 · 7 fontes + benchmark competitors

Unified hub: TaDa Delivery consolidated report, churn, Lovers Plus, Annual Review, Appbot, sellers/couriers and LATAM benchmark.

Executive summary

Sustainable growth = less friction + more predictability — not more persuasion or promotional complexity.

TaDa does not need to convince consumers to want beverages; it needs to be available, reliable and simple when the need appears. Reviews (1,630), churn survey (379), transactional data and Lovers Plus (111 + 5k/5k) converge: the bottleneck is operational consistency and post-failure recovery.

Churn: US$60M GMV across four patterns — 40% gradual loss (US$24M), with churn rising from 62% → 74% at 3+ frictions. Value exit is not only price: ~60% move to physical retail, ~10% to a competing app. Event-driven churn: >35 min concentrates ~48% of the bucket.

Lovers Plus proves the model: 92% Perfect Orders, 48% SLA 15 min (vs 35% Core). 74% bought outside the app in 30 days, but 76.6% would buy more if stock, hours and trust improved — intent exists, friction blocks it.

2026 operations: 6.27M valid YTD orders; Colombia accelerates, Mexico monetizes (AOV +19.6%). Competitors: Rappi is the only benchmark across all three markets; TaDa should compare by mission and stakeholder, not copy breadth.

- Reviews Appbot: 1.630
- Polarização: 33% 1★ / 55% 5★
- GMV churn (4 grupos): US$ 60M
- Pedidos válidos YTD: 6,27M
- SLA 15 min LP vs Core: 48% / 35%
- Churn c/ 3+ fricções: 74%
- LP compra fora (30d): 74%
- Benchmark LATAM: MX · PE · CO

Section guide

Consumer voice — 3.44 polarization; account, bugs and delivery as critical themes

Churn and retention — 4 patterns, accumulated friction, physical retail exit, event >35 min

Lovers Plus — Habit through predictability; SLA15 and favorite SKU; less promotion than Core

Operations and markets — Country playbooks; Rewards CO/MX/PE

Synthesis and priorities — 6 integrated principles; P0–P2 roadmap and minimum KPIs

Competitors — Rappi cross-country; Turbo/ETA; post-Delivery Hero PE risk

Sellers and couriers — Seller–courier handoff; Small in discovery vs Large anchor; 4 courier profiles

Research tabs in dashboard

Executive summary — Updated thesis — consumer, churn, LP, operations and competitors

Method and sources — Scope, limitations and evidence cross-check

Consumer voice — 1,630 Appbot reviews (Apr–Sep 2026)

Churn and retention — Learning Agenda slides 13+ — framework, friction, value exit, event-driven

Lovers Plus — Research Complete 3 — 5 blocos + transacional out/25–jan/26

Operations and markets — 2026 Annual Review by country

Sellers and couriers — 2026 clustering — 333 sellers, 794 couriers, 9+4 profiles

Integrated synthesis — Principles appearing across multiple sources

Priorities — P0–P2 roadmap and minimum KPI panel

Source files — PDFs, CSVs and consolidated deck

Competitors — LATAM benchmark — Rappi, PedidosYa, Justo and 2027 plan

Sellers & couriers research

Sellers and couriers · Set 2026

Volume is not maturity — sellers and couriers need different plays by scale, maturity and type of work.

Sellers want to grow without losing service quality; couriers want less time lost to incomplete information, confusing routes and unsupported exceptions. Clustering organizes the problem into decision profiles for product, operations, commercial and research teams.

In the matched sample (322 sellers with metrics), 85 are Small in discovery — the largest cell, with the lowest satisfaction (3.86/5) and metric recognition (2.9/8). Large anchor (49 sellers, ~15% of the base) represents ~35% of estimated weekly sample value.

Couriers (794 responses in the report; 793 complete in the export): 72% with 4–5 satisfaction coexist with high friction — 46.9% cite customer communication and 36.5% confusing routes/addresses. The failure appears in the seller → courier → customer → platform handoff.

- Sellers (survey): 333
- Matched sellers: 322
- Couriers (survey): 794
- Perfis de decisão: 9 + 4

Method:

Seller survey Typeform — 333 responses; 325 unique IDs; 322 matched to metrics. Operations, TaDa dependence, preparation, metric recognition, review frequency, satisfaction and open challenges.

Seller metrics (results-2/3) — 327 IDs; 322 matched to survey. Country, city, model, tenure, orders/week, cancellations, GMV, rating and delivery time.

Courier survey Typeform — 794 complete responses. Stores, fixed relationship, tenure, days/hours, gig apps, friction, satisfaction and open improvement.

Seller Atlas 2026 — Interpretation deck. Profiles, normalized cuts and strategic seller + courier reading.

---

9. UX & product roadmap

Principles

1 — Reliability: See and receive the order

Order sound, session stability, refresh-free push, map that loads under peak load. Without this layer, prettier screens don't fix Saturday.

2 — Peak decision: Distribute fast without leaving the screen

Map + kanban, visual priority, multi-assign to riders already en route. Reduces Telegram workarounds and expired orders.

3 — Management & understanding: Metrics, reimbursement, day planning

Date filters, detailed financial breakdown, quantity in portfolio, AI explanations. Sellers need to trust what they receive and act on daily KPIs.

Actors

Seller — Store operation: orders, map, portfolio, metrics, reimbursement, and financial reconciliation.

Courier — Delivery flow: notifications, route, arrival status, earnings and payment visibility.

Admin — OPS and commercial tooling: KPI cockpit per POC, coverage maps, polygons, coupons, acquisition.

CX — Support agents: consumer visibility, courier tracking, cancellation reasons, fast seller channel.

Roadmap · Seller

[NOW · Critical] order-alert-session — Order alert + session stability

Reliable push notification with sound when a new order arrives. Session must not close silently — sellers lose orders while restocking.

- Puebla 3/5: no sound → expired orders (San Jerónimo); app closes 4–5×/day (Zavaleta)
- CDMX Saturdays: order doesn't reach courier without manual refresh (Mixcoac, Bahia)
- Peru Merino + San Pedro: sound intermittent — missed orders while picking alone

Success criteria:

- Sound plays even when app is backgrounded
- Session persists through a full peak shift

[NOW · Critical] map-assign-stay — Operations map: stay on screen when assigning

Assigning a courier must not kick the seller off the map. Fix store pin disappearing and blank map under load.

- Los Alpes: 'The ideal is that it doesn't take us out, that it stays here on this screen'
- Churubusco: store pin disappeared from map
- Forjadores: map/table blank at 20+ orders during World Cup promo

Success criteria:

- Assign courier without navigation away from map
- Map loads 50 concurrent orders without freeze

[NOW · High] map-visual-priority — Visual priority on operations map

Differentiate orders by urgency, prep time, and first-order badge. Today everything looks red — sellers can't decide what to attack first.

- Bahia: 'Then since everyone is red… some differentiation to know which ones are left'
- Puebla: first-order badge actively used and valued across POCs

[NOW · Critical] portfolio-quantity — Portfolio: quantity field in minimum list

Show stock quantity directly in the portfolio list with optional auto-decrement on sale. On/off toggle alone doesn't reflect real stock.

- CDMX 4/4: unanimous #1 ask — inventory without real quantity
- Los Alpes: system shows 3,000 units when reality is much lower
- Peru 3/3: on/off only, manual nightly count; VTEX/Tuca benchmark cited

[NOW · High] portfolio-filters — Portfolio: filters and search

Filter by availability, brand, and bestsellers. Fix broken search (model names, combos). Unify confusing minimum vs full catalog navigation.

- CDMX 4/4: huge unordered list, search requires exact name
- Puebla: search breaks on modelo, combos; wants alphabetical / brand tab (San Jerónimo)
- Mixcoac: two confusing screens — minimum portfolio vs full catalog
- Peru 3/3: combos don't disable together; search misses Pilsen, 473 ml formats

[NOW · High] metrics-date-filter — Metrics: date range selector

Replace fixed 7-day window with day, week, and month selectors. Sellers need yesterday's numbers to manage today's team.

- CDMX 4/4: want daily filter like previous app
- Churubusco: 'I miss that part because this one goes away for the last 7 days'
- Zavaleta: wants orders-per-hour view (today via Ale's Excel)
- Peru 3/3: KPI screen locked to rolling 7 days; ranking peer set opaque; SLA 35 hidden

[NOW · High] reimbursement-breakdown — Reimbursement: detailed breakdown of what they receive

Weekly reimbursement report with line-by-line degloss: commercial difference, coupons, last mile, refunds, and final payout. Sellers today reconcile in Excel/notebook because they don't trust or understand the platform number.

- Interview script: 'Do you understand each line? What's left to trust in the final number?' — Figma concept tested
- Bahia: 30 min/week manual reconciliation in Ricardo's Excel; does not use app financial report
- Los Alpes: notebook + daily Excel; wants to degloss for random spot-check
- Churubusco: trusts payment but cannot audit order by order in platform

Success criteria:

- Each payment line explained in plain language
- Weekly PDF export per store (concept validated in visit)
- Drill-down from total → concept → order list
- Seller can spot-check a random order against payout

[NOW · High] financial-report-date-filter — Financial report: fix date filter + daily cut

Date filter in financial report has a bug. Sellers want today's cut and yesterday's routes — not only a rolling window.

- Mixcoac: date filter in financial report broken
- Product meeting: stores want today's cut and yesterday's routes on platform
- Los Alpes: weekend manual notebook because app report doesn't match their cycle

Success criteria:

- Filter by day / week / custom range without bug
- Yesterday's routes visible for courier payment check

[NOW · Medium] metrics-ai-mvp — Metrics: AI copilot (MVP)

Pre-defined explanations per metric ('what this means' + 'what to do if red'). Weekly plain-language summary — not open-ended chat.

- CDMX: sellers don't understand ranking, fulfillment score, or what impacts it
- Talabera: limited KPI use — checks delivery time visually only

[NEXT · High] map-kanban-unified — Map + kanban on one screen

Combine real-time map (couriers + order pins) with stage columns (waiting / preparing / ready). Drag ready orders to assign on map without leaving the view.

- CDMX 4/4: operations map is most-used screen at peak; requested map + kanban together
- Interview script: Figma concept tested in every CDMX visit

[NEXT · High] multi-assign-seller — Multi-assign orders to courier already en route

After courier accepts order A, seller can bundle compatible orders B and C going the same direction. Courier confirms or rejects the batch.

- Zavaleta: 'Cannot assign second order to courier on route'
- Churubusco: still uses Telegram to route multiple orders
- Peru La Marina: #3 ask — assign second order to courier already en route

[NEXT · High] metrics-hourly — Metrics: hourly operational view

Orders per hour vs couriers per hour. Compare today vs yesterday vs same day last week.

- Zavaleta: wants orders-per-hour + couriers-per-hour in platform
- CDMX: forecast shows 30 expected, 7 arrived — can't staff by eye
- Peru La Marina + Merino: WebPO demand-by-hour praised; want same in seller KPIs

[NEXT · High] dispatch-sla-split — Dispatch SLA: split 'prepared' vs 'picked up'

Order ready in 2–3 min but courier arrives at 15 min — dispatch metric goes red unfairly. Seller dashboard must show which side failed.

- Puebla 3/5: dispatch SLA penalizes ready orders without courier
- Forjadores: 50 orders / 8 couriers — KPIs missed despite deliveries under 35 min

[NEXT · Medium] reassign-order — Reassign order after courier starts

When courier is sent to load but can't complete, seller reassigns without canceling — similar to Tucan flow Churubusco referenced.

- Churubusco: 'Prefer to reassign as in Tucan'

[NEXT · Medium] financial-export-excel — Financial report: export to Excel

Export reimbursement and sales breakdown for taxes, courier payments, and accountant. Parallel spreadsheets today because export is insufficient.

- Churubusco: export financial report to Excel requested
- CDMX cross-store: payments, taxes and refunds in parallel spreadsheets

[NEXT · High] courier-jumbo-seller-view — Courier payments (Jumbo): weekly summary on seller platform

Weekly courier payment closure visible on seller platform — summary by concept, line by line. Same data as financial Excel, accessible to store owner.

- Product meeting: Courier Financial Report (Jumbo) launching — weekly summary on platform
- Widely used on Sundays; OPS concern: everyone at store sees values — design permissions
- Stores want today's cut and yesterday's routes

Success criteria:

- Weekly summary by concept (not order-level in V1)
- Role-based visibility for sensitive amounts

[NEXT · Medium] metrics-ai-advanced — Metrics: AI root-cause insights

AI explains why score dropped: '8 of 15 orders were ready in <3 min but courier arrived after 10 min.'

- OPS meetings: need daily KPIs, not 7-day averages

[LATER · High] in-app-chat-seller — In-app chat (seller ⇔ customer / courier)

Order-context chat replacing WhatsApp and personal calls. Pre-defined message templates for common cases.

- CDMX 4/4: 100% WhatsApp/calls today — no audit trail
- CX meeting: pre-defined messages pilot agreed for MX
- Peru 3/3: WhatsApp workaround; sellers remember in-app chat in previous tool

[LATER · Medium] forecast-trust — Reliable daily order forecast on home

Fix inflated or missing forecast so sellers can staff couriers with confidence. Show range, not false precision.

- Bahia: marked 30, 7 arrived
- Los Alpes: ignores forecast, staffs by eye

[LATER · Medium] notification-center — Notification center (promos, supply, CX)

Centralize promo calendar, supply delivery alerts, and CX updates — replace dozens of WhatsApp groups.

- San Jerónimo: information overload from dozens of WhatsApp groups
- OPS workshop: notification center tested in Bolivia → MX

[LATER · Medium] metrics-ai-conversational — Metrics: conversational AI assistant

Open Q&A for less digital store owners after MVP proves comprehension value.

- Talabera and parts of Puebla: limited KPI literacy

[LATER · Medium] portfolio-unified — Unified portfolio: minimum + full catalog

Single navigation for minimum portfolio and full catalog.

- Mixcoac: two confusing screens with different product sets
- Los Alpes: 183+ SKUs reviewed manually

Roadmap · Courier

[NOW · High] ya-llegue-fix — 'Ya llegué' button that actually notifies the customer

Courier presses arrival but consumer still sees 'aún va a salir'. Push exists but is too subtle — 90% of couriers call instead.

- Bahia courier: '90% I have to call them on the phone to let them know that I have arrived'
- Mixcoac: consumer sees wrong status after courier presses llegue

[NOW · Critical] courier-order-push — Reliable order push to courier app

Order must arrive on courier app without manual refresh or ticket code. Fix app freeze requiring reinstall.

- Mixcoac Saturdays: order doesn't reach courier without refresh
- Churubusco: courier app freezes — needs reinstall
- OPS workshop: Android version issues on courier phones

[NEXT · High] courier-route-map — Map + multi-stop route

When seller sends a batch, courier sees optimized stop sequence on a map with ETA per stop. Allow manual reorder of stops.

- Bahia courier: wants to reorder delivery sequence
- Zavaleta + Forjadores: peak saturation with 8 couriers / 40–50 orders

[NEXT · High] courier-financial-statement — Courier Financial Report (Jumbo): earnings statement

Weekly payment communication directly on courier app — summary by concept, line by line. V1 without order-level detail; dream: on-demand statement.

- Product meeting: launch Courier Financial Report this week
- Widely used on Sundays for payment closure
- Dream: statement on request + direct bank transfer (complex: customer bank account)

[LATER · Medium] courier-earnings-daily — Daily earnings visibility while delivering

Courier wants to know how much they earned today without waiting for Sunday closure. App should help reconcile with store.

- Interview script: 'How do you know how much you won? Does the app help with this?'
- Zavaleta: Uber vs TaDa courier economics debate

Roadmap · Admin

[NOW · Critical] admin-kpi-cockpit — Real-time KPI cockpit per POC

Admin master console: view SLA, free rate, fill rate, orders, and inventory by store without logging into each seller. Update every 1.5–2 hours acceptable; critical for weekend on-call.

- OPS workshop (Daniela/John): 'We would love a summary where we can see real time... SLA, free rate'
- Need cockpit especially Saturdays and Sundays who are on guard
- John helped create Power BI POC view — they want this in platform
- OPS next step: Admin console / real-time KPI cockpit — resume John Power BI

Success criteria:

- All POCs in one view with red/yellow/green thresholds
- Drill-down to single store without seller credentials
- Detect new POCs that are stuck

[NEXT · High] admin-console-vitex — Admin console: view any seller without credentials (Vitex/Armis style)

OPS enters seller by seller with credentials that change. Need mirror to see live inventory, orders, and map with store code only.

- OPS workshop (Luis): 'Before on Vitex/Armis: store code, see live inventory'
- CX benchmark: Vitex-style account to view any seller without credentials
- OPS audits stock entering seller by seller — process not friendly

Success criteria:

- Single admin login → pick POC → see orders + inventory + map
- No credential bag per store

[NEXT · High] admin-heatmap-orders — Order heat map integrated in Admin

Visualize order concentration in coverage without downloading data to Kepler and using 3 external tools. Detect fraud and white spaces.

- OPS workshop (Nadia): 'Ultra laborious process... I use three programs to download the maps'
- Detected fraud: 90 chips per POC with manual heat map work
- OPS next step: Order heat map integrated in Admin/coverage

[NEXT · Medium] admin-dispatch-kpi-network — Network-level dispatch SLA view

See dispatch failures split by prep vs pickup across all POCs in a city. Supports fair comparison and staffing decisions at OPS level.

- Puebla 3/5: unfair dispatch SLA when courier staffing is the bottleneck
- OPS: progressive distribution and peak staffing requested

[NEXT · Medium] admin-b2b-courier-forecast — B2B report: couriers needed per POC per week

Automatic suggestion of how many couriers a POC needs based on order growth — benchmark Uber Eats AI for supervisor.

- OPS workshop: 'B2B report so POC knows how much delivery person for following week'
- Bad forecast (20–40% error) generates chain of bad experiences

[LATER · Medium] admin-polygon-neighbor — Polygon editor: see neighboring POC coverage

When modifying polygons, show adjacent store coverage to close white space without checking street by street in external tools.

- OPS workshop: 'If we can see the pop coverage next door it would help a lot'
- Overlapping debates in Product meeting (Puebla test)
- Peru Merino: +70 orders when neighbors turn off SKUs; clients cancel 10–12× to route to preferred POC

[LATER · Medium] admin-seller-acquisition — Seller acquisition: bulk download + cleaner onboarding

Registration landing active but data must be exported one by one. Onboarding asks ~10 fields; incorrect phone numbers lose leads.

- OPS workshop: 'They have to enter one by one to get the data'
- Some put tooth number in phone field — lead lost

[LATER · Medium] admin-coupon-categories — Coupon admin linked to product categories

Coupon management not linked to current categories (old Cuca taxonomy). Unique codes loaded manually; first-purchase abuse with multiple accounts.

- OPS workshop: 'Coupon admin is not linked to the product categories'
- They create different accounts on same device for first-purchase coupon

[LATER · Medium] admin-sku-promo-protection — SKU protection for active promos

Alert before mass SKU shutdown eliminates combos used in promos. Teams had to recreate World Cup combos without knowing if data was lost.

- OPS workshop: 'SKU disappeared, was eliminated and we had to recreate it'
- We don't know if we were going to lose previous data

Roadmap · CX

[NOW · High] cx-fast-seller-channel — Fast seller support channel (not email-only)

Sellers resolve disputes faster by phone than email tickets answered next day. CX needs a channel that matches peak speed.

- Talabera + Forjadores: CX email answered next day — want WhatsApp-speed
- Bahia: prefers calling customer directly over CI ticket
- Puebla cross-store: CX / ticket response too slow

[NOW · Critical] cx-courier-map-visibility — CX visibility of courier location on map

Agents are completely blind to courier position — cannot guide or calm consumer during late-order tickets (~40% of volume).

- CX meeting: 'We have no idea or visibility of where the courier is going... completely blind'
- CX meeting: distributor can operate offline; consumer map doesn't follow reality
- Pin stopped at store with courier already on the way during visit
- Peru 3/3: map pin stuck at store, 5–10% courier visibility — WhatsApp tracking

Success criteria:

- CX agent sees same live map as seller (read-only)
- Offline courier status visible

[NOW · High] cx-cancellation-reason — Mandatory cancellation / expiration reason

Every canceled or expired order must carry a structured reason visible to CX. Free-text 'other' is lost and doesn't reach agents.

- CX meeting: 'Every time an order expires or is canceled I have the reason... I want it to be mandatory'
- When seller clicks 'other'... we lose that part that he wrote
- OPS connectsToStores: reason for cancellation needed for disputes

[NOW · High] cx-predefined-messages — Pre-defined seller → customer messages (pilot)

Pilot pre-defined messages in seller app for coordination cases — validated by CX for MX market.

- CX meeting next step: pilot pre-defined messages
- ~40% of tickets are coordination (no-code, no-answer, wrong address)
- Overall roadmap Now: pilot pre-defined seller→customer messages
- Peru: deposit-bottle disputes, 10–15 min door waits — no in-app channel

[NEXT · High] cx-consumer-visibility — Agent view of consumer app (wallet, points, screen)

CX cannot see what the consumer sees — always asks for screenshots. No personalization between new and frequent customers.

- CX meeting: 'We cannot visualize what they see, we do not know what they have in their wallet'
- We're always asking for screenshots, always, always
- Attention is equal for everyone when it shouldn't be

[NEXT · High] cx-unified-seller-view — Unified seller view for agents (Vitex-style)

One CX account to view inventory, orders, and map of any seller without asking for credentials or screenshots.

- CX meeting: 'Something similar to Vitex... an account where you log in, you see the seller, their orders, their inventory'
- CX + OPS workshop: ecosystem not connected between CX, seller and courier

[NEXT · Medium] cx-decision-tree — Decision tree for complaints (Uber/iFood benchmark)

Self-service complaint resolution before reaching a human. iFood DC Delivery already has it; reduces ticket volume.

- CX meeting: 'Uber gives you a decision tree... don't contact a human'
- OPS next step: CX decision tree — Uber/iFood benchmark

[NEXT · Medium] cx-delivered-not-received — Simplify 'delivered not received' flow

High-impact ticket category. Courier has 3 options to mark endless delivery — CX wants only 1 clear path.

- CX meeting: 'Delivered and not received... has an impact on my tickets'
- There are three options to mark orders endlessly, I want there to be only one

[LATER · Medium] cx-consumer-cancellation — Consumer self-cancel / address modify flow

~20% of tickets are cancellation requests. Allow address modify within perimeter without canceling; block repeat 1-min cancellers.

- CX meeting: 'Almost 20% of my tickets are intended to be cancelled'
- Consumers cancel 2–5 consecutive times within the first minute

[LATER · Medium] cx-ai-bots-ops — AI bots for team management + Braze verification

AI bots to help CX manage volume. Verify if user received coupon/communication via Braze history by email.

- CX meeting: 'AI bots... can be decisive'
- OPS admin: don't know if user received coupon — need Braze history

---

10. Competitors benchmark

Delivery benchmark — Mexico, Peru & Colombia · Sep 9, 2026

Rappi is the only cross-country benchmark across all three markets; direct competition shifts by country — Uber Eats in Mexico, PedidosYa in Peru, Rappi with no active rival from this group in Colombia.

In 2026, Rappi focused on quick commerce, AI, coverage and logistics efficiency. PedidosYa in Peru prioritized densification, non-food and partner fintech. Uber Eats in Mexico expanded retail, ads, last-mile and mobility.

For 2027, the corporate event with a public date is Uber's bid for Delivery Hero (closing expected in H2), including PedidosYa Peru — until closing, companies remain independent.

For TaDa: compare by mission and stakeholder, not isolated screens. Peru is the highest-risk and highest-opportunity market; Mexico requires testing the same mission in superapp vs mobility ecosystem.

- Platforms: 3
- Countries covered: 3
- Sources: 39
- Horizon: 2026–27

Decision insights

Consumer breadth (Rappi) — Most complete reference: restaurants, grocery, pharmacy, convenience, beverages, pets, gifts, errands, travel, payments and subscription in one ecosystem. Social discovery, personalization and AI search.

Implication: TaDa should map which verticals are core vs adjacent before copying breadth.

Merchant & monetization (Rappi + Uber) — Uber combined ads, offers, recommendations and reporting; Rappi added AI catalog creation and a partner portal with metrics and campaigns.

Implication: Benchmark time to first order, ROAS and catalog completeness — not features alone.

High velocity (Rappi Turbo) — Consistent reference across all three countries. Mexico: Chedraui alliance (<10 min, 8 cities). Peru: electrified Turbo stations with sustainability and financing.

Implication: Separate speed from reliability — measure P50/P90 ETA and failure compensation.

2027 risk — Peru (Uber + Delivery Hero) — Delivery Hero acquisition could connect mobility, subscription, merchant ads and logistics to the PedidosYa base. No announcement promises brand or app migration.

Implication: Active watchlist; do not treat integration as certain in TaDa roadmap.

2027 plan highlights

Delivery Hero acquisition (Uber + PedidosYa Peru) — May connect mobility, subscription, ads and delivery; brand and app unknown

Evidence: Closing expected H2 2027 · *Confidence:* Confirmed

Partner fintech (PedidosYa Peru) — Merchant/courier retention; risk controls

Evidence: Payments late 2026 and 2027 · *Confidence:* Announced direction

AI & automation (Rappi regional) — Next layer with quality control

Evidence: Recommendation, support, forecasting, store · *Confidence:* Inference

Integrated platform (Uber global) — If DH closes, denser economic logic in Peru

Evidence: Unified search mobility + delivery + retail · *Confidence:* Announced direction
